# Balanced Trees

## Motivation

**Binary search tree:**

# Balanced Trees

## Motivation

### Binary search tree:

- ▶ With `BinarySearchTree` we could perform an `lookup` or `insert` in  $O(d)$ , with  $d$  being the `depth` of the tree

# Balanced Trees

## Motivation

### Binary search tree:

- ▶ With `BinarySearchTree` we could perform an `lookup` or `insert` in  $O(d)$ , with  $d$  being the `depth` of the tree
- ▶ Best case:  $d = O(\log n)$

# Balanced Trees

## Motivation

### Binary search tree:

- ▶ With `BinarySearchTree` we could perform an `lookup` or `insert` in  $O(d)$ , with  $d$  being the `depth` of the tree
- ▶ Best case:  $d = O(\log n)$ 
  - ▶ If the keys are inserted randomly

# Balanced Trees

## Motivation

### Binary search tree:

- ▶ With `BinarySearchTree` we could perform an `lookup` or `insert` in  $O(d)$ , with  $d$  being the `depth` of the tree
- ▶ Best case:  $d = O(\log n)$ 
  - ▶ If the keys are inserted randomly
- ▶ Worst case:  $d = O(n)$

# Balanced Trees

## Motivation

### Binary search tree:

- ▶ With `BinarySearchTree` we could perform an `lookup` or `insert` in  $O(d)$ , with  $d$  being the `depth` of the tree
- ▶ Best case:  $d = O(\log n)$ 
  - ▶ If the keys are inserted randomly
- ▶ Worst case:  $d = O(n)$ 
  - ▶ if the keys are inserted in ascending / descending order  
(20, 19, 18, ...)

# Balanced Trees

## Motivation

**Gnarley trees:**

# Balanced Trees

## Motivation

**Balanced trees:**

# Balanced Trees

## Motivation

### **Balanced trees:**

- ▶ We do not want to rely on certain properties of our **key set**

# Balanced Trees

## Motivation

### **Balanced trees:**

- ▶ We do not want to rely on certain properties of our **key set**
- ▶ We explicitly want a depth of  $O(\log n)$

# Balanced Trees

## Motivation

### Balanced trees:

- ▶ We do not want to rely on certain properties of our **key set**
- ▶ We explicitly want a depth of  $O(\log n)$
- ▶ We **rebalance** the tree from time to time

# Balanced Trees

## Motivation

**How do we get a depth of  $O(\log n)$ ?**

# Balanced Trees

## Motivation

How do we get a depth of  $O(\log n)$ ?

- ▶ **AVL-Tree:**

# Balanced Trees

## Motivation

**How do we get a depth of  $O(\log n)$ ?**

- ▶ **AVL-Tree:**

- ▶ Binary tree with 2 children per node

# Balanced Trees

## Motivation

How do we get a depth of  $O(\log n)$ ?

- ▶ **AVL-Tree:**

- ▶ Binary tree with 2 children per node
- ▶ Balancing via “rotation”

# Balanced Trees

## Motivation

How do we get a depth of  $O(\log n)$ ?

- ▶ **AVL-Tree:**

- ▶ Binary tree with 2 children per node
- ▶ Balancing via “rotation”

- ▶ **(a,b)-Tree** or **B-Tree:**

# Balanced Trees

## Motivation

How do we get a depth of  $O(\log n)$ ?

- ▶ **AVL-Tree:**

- ▶ Binary tree with 2 children per node
- ▶ Balancing via “rotation”

- ▶ **(a,b)-Tree** or **B-Tree:**

- ▶ Node have between  $a$  and  $b$  children

# Balanced Trees

## Motivation

How do we get a depth of  $O(\log n)$ ?

- ▶ **AVL-Tree:**

- ▶ Binary tree with 2 children per node
- ▶ Balancing via “rotation”

- ▶ **(a,b)-Tree** or **B-Tree:**

- ▶ Node have between  $a$  and  $b$  children
- ▶ Balancing through **splitting** and **merging** nodes

# Balanced Trees

## Motivation

How do we get a depth of  $O(\log n)$ ?

- ▶ **AVL-Tree:**

- ▶ Binary tree with 2 children per node
- ▶ Balancing via “rotation”

- ▶ **(a,b)-Tree or B-Tree:**

- ▶ Node have between  $a$  and  $b$  children
- ▶ Balancing through **splitting** and **merging** nodes
- ▶ Used in data bases and file systems

# Balanced Trees

## Motivation

How do we get a depth of  $O(\log n)$ ?

- ▶ **AVL-Tree:**

- ▶ Binary tree with 2 children per node
- ▶ Balancing via “rotation”

- ▶ **(a,b)-Tree or B-Tree:**

- ▶ Node have between  $a$  and  $b$  children
- ▶ Balancing through **splitting** and **merging** nodes
- ▶ Used in data bases and file systems

- ▶ **Red-Black-Tree:**

# Balanced Trees

## Motivation

How do we get a depth of  $O(\log n)$ ?

- ▶ **AVL-Tree:**

- ▶ Binary tree with 2 children per node
- ▶ Balancing via “rotation”

- ▶ **(a,b)-Tree or B-Tree:**

- ▶ Node have between  $a$  and  $b$  children
- ▶ Balancing through **splitting** and **merging** nodes
- ▶ Used in data bases and file systems

- ▶ **Red-Black-Tree:**

- ▶ Binary tree with “black” and “red” nodes

# Balanced Trees

## Motivation

How do we get a depth of  $O(\log n)$ ?

- ▶ **AVL-Tree:**

- ▶ Binary tree with 2 children per node
- ▶ Balancing via “rotation”

- ▶ **(a,b)-Tree or B-Tree:**

- ▶ Node have between  $a$  and  $b$  children
- ▶ Balancing through **splitting** and **merging** nodes
- ▶ Used in data bases and file systems

- ▶ **Red-Black-Tree:**

- ▶ Binary tree with “black” and “red” nodes
- ▶ Balancing through “rotation” and “recoloring”

# Balanced Trees

## Motivation

How do we get a depth of  $O(\log n)$ ?

► **AVL-Tree:**

- Binary tree with 2 children per node
- Balancing via “rotation”

► **(a,b)-Tree or B-Tree:**

- Node have between  $a$  and  $b$  children
- Balancing through **splitting** and **merging** nodes
- Used in data bases and file systems

► **Red-Black-Tree:**

- Binary tree with “black” and “red” nodes
- Balancing through “rotation” and “recoloring”
- Can be interpreted as (2, 4)-tree

# Balanced Trees

## Motivation

How do we get a depth of  $O(\log n)$ ?

► **AVL-Tree:**

- Binary tree with 2 children per node
- Balancing via “rotation”

► **(a,b)-Tree or B-Tree:**

- Node have between  $a$  and  $b$  children
- Balancing through **splitting** and **merging** nodes
- Used in data bases and file systems

► **Red-Black-Tree:**

- Binary tree with “black” and “red” nodes
- Balancing through “rotation” and “recoloring”
- Can be interpreted as (2, 4)-tree
- Used in C++ `std::map`, Java `SortedMap`

**AVL-Trees**

(a,b)-Trees

Introduction

Runtime Complexity

Red-Black Trees

# Balanced Trees

## AVL-Tree

**AVL-Tree:**

# Balanced Trees

## AVL-Tree

### **AVL-Tree:**

- ▶ Gregory Maximovich **A**delson-**V**elskii, Yevgeniy Mikhailovlovich **L**andis (1963)

# Balanced Trees

## AVL-Tree

### **AVL-Tree:**

- ▶ Gregory Maximovich **A**delson-**V**elskii, Yevgeniy Mikhailovlovich **L**andis (1963)
- ▶ Search tree with modified `insert` and `remove` operations while satisfying a `depth` condition

# Balanced Trees

## AVL-Tree

### **AVL-Tree:**

- ▶ Gregory Maximovich **A**delson-**V**elskii, Yevgeniy Mikhailovlovich **L**andis (1963)
- ▶ Search tree with modified **insert** and **remove** operations while satisfying a **depth** condition
- ▶ Prevents degeneration of the search tree

# Balanced Trees

## AVL-Tree

### AVL-Tree:

- ▶ Gregory Maximovich **A**delson-**V**elskii, Yevgeniy Mikhailovlovich **L**andis (1963)
- ▶ Search tree with modified **insert** and **remove** operations while satisfying a **depth** condition
- ▶ Prevents degeneration of the search tree
- ▶ Height difference of left and right subtree is at maximum one

# Balanced Trees

## AVL-Tree

### AVL-Tree:

- ▶ Gregory Maximovich **A**delson-**V**elskii, Yevgeniy Mikhailovlovich **L**andis (1963)
- ▶ Search tree with modified **insert** and **remove** operations while satisfying a **depth** condition
- ▶ Prevents degeneration of the search tree
- ▶ Height difference of left and right subtree is at maximum one
- ▶ With that the height of the search tree is always  $O(\log n)$

# Balanced Trees

## AVL-Tree

### AVL-Tree:

- ▶ Gregory Maximovich **A**delson-**V**elskii, Yevgeniy Mikhailovlovich **L**andis (1963)
- ▶ Search tree with modified **insert** and **remove** operations while satisfying a **depth** condition
- ▶ Prevents degeneration of the search tree
- ▶ Height difference of left and right subtree is at maximum one
- ▶ With that the height of the search tree is always  $O(\log n)$
- ▶ We can perform all basic operations in  $O(\log n)$

- ▶ After rotation to the right:
  - ▶ Subtree **A** is a layer higher and subtree **C** a layer lower

# Balanced Trees

## AVL-Tree - Rebalancing

### Rotation:

Figure: Before rotating

Figure: After rotating

- ▶ Central operation of **rebalancing**
- ▶ After rotation to the right:
  - ▶ Subtree **A** is a layer higher and subtree **C** a layer lower
  - ▶ The parent child relations between nodes **x** and **y** have been swapped

# Balanced Trees

AVL-Tree - Rebalancing

**AVL-Tree:**

# Balanced Trees

## AVL-Tree - Rebalancing

### **AVL-Tree:**

- ▶ If a height difference of  $\pm 2$  occurs on an `insert` or `remove` operation the tree is rebalanced

# Balanced Trees

## AVL-Tree - Rebalancing

### **AVL-Tree:**

- ▶ If a height difference of  $\pm 2$  occurs on an `insert` or `remove` operation the tree is rebalanced
- ▶ Many different cases of rebalancing

# Balanced Trees

## AVL-Tree - Rebalancing

### **AVL-Tree:**

- ▶ If a height difference of  $\pm 2$  occurs on an `insert` or `remove` operation the tree is rebalanced
- ▶ Many different cases of rebalancing
- ▶ **Example:** `insert` of 1, 2, 3, ...

# Balanced Trees

## AVL-Tree - Rebalancing

### **AVL-Tree:**

- ▶ If a height difference of  $\pm 2$  occurs on an `insert` or `remove` operation the tree is rebalanced
- ▶ Many different cases of rebalancing
- ▶ **Example:** `insert` of 1, 2, 3, ...
- ▶ <http://people.ksp.sk/~kuko/bak>

# Balanced Trees

## AVL-Tree - Rebalancing

### AVL-Tree:

- ▶ If a height difference of  $\pm 2$  occurs on an **insert** or **remove** operation the tree is rebalanced
- ▶ Many different cases of rebalancing
- ▶ **Example:** **insert** of 1, 2, 3, ...
- ▶ <http://people.ksp.sk/~kuko/bak>

# Balanced Trees

## AVL-Tree - Summary

**Summary:**

# Balanced Trees

## AVL-Tree - Summary

### Summary:

- ▶ Historical the first search tree providing guaranteed `insert`, `remove` and `lookup` in  $O(\log n)$

# Balanced Trees

## AVL-Tree - Summary

### Summary:

- ▶ Historical the first search tree providing guaranteed `insert`, `remove` and `lookup` in  $O(\log n)$
- ▶ However not amortized update costs of  $O(1)$

# Balanced Trees

## AVL-Tree - Summary

### Summary:

- ▶ Historical the first search tree providing guaranteed `insert`, `remove` and `lookup` in  $O(\log n)$
- ▶ However not amortized update costs of  $O(1)$
- ▶ Additional memory costs: We have to save a height difference for every node

# Balanced Trees

## AVL-Tree - Summary

### Summary:

- ▶ Historical the first search tree providing guaranteed **insert**, **remove** and **lookup** in  $O(\log n)$
- ▶ However not amortized update costs of  $O(1)$
- ▶ Additional memory costs: We have to save a height difference for every node
- ▶ Better (and easier) to implement are **(a,b)**-trees

Runtime Complexity

Red-Black Trees

# $(a,b)$ -Trees

## Introduction

**$(a,b)$ -Tree:**

# $(a,b)$ -Trees

## Introduction

### **$(a,b)$ -Tree:**

- ▶ Also known as **b-tree** (b for “balanced”)

# (a,b)-Trees

## Introduction

### **(a,b)-Tree:**

- ▶ Also known as **b-tree** (b for “balanced”)
- ▶ Used in data bases and file systems

# (a,b)-Trees

## Introduction

### (a,b)-Tree:

- ▶ Also known as **b-tree** (b for “balanced”)
- ▶ Used in data bases and file systems

### Idea:

# (a,b)-Trees

## Introduction

### (a,b)-Tree:

- ▶ Also known as **b-tree** (b for “balanced”)
- ▶ Used in data bases and file systems

### Idea:

- ▶ Save a varying number of elements per node

# (a,b)-Trees

## Introduction

### (a,b)-Tree:

- ▶ Also known as **b-tree** (b for “balanced”)
- ▶ Used in data bases and file systems

### Idea:

- ▶ Save a varying number of elements per node
- ▶ So we have space for elements on an `insert` and balance operation

# $(a,b)$ -Trees

## Introduction

**$(a,b)$ -Tree:**

# $(a,b)$ -Trees

## Introduction

### **$(a,b)$ -Tree:**

- ▶ All leaves have the same depth

# (a,b)-Trees

## Introduction

### **(a,b)-Tree:**

- ▶ All leaves have the same depth
- ▶ Each inner node has  $\geq a$  and  $\leq b$  nodes  
(Only the root node may have less nodes)

# (a,b)-Trees

## Introduction

### (a,b)-Tree:

- ▶ All leaves have the same depth
- ▶ Each inner node has  $\geq a$  and  $\leq b$  nodes  
(Only the root node may have less nodes)

# (a,b)-Trees

## Introduction

### (a,b)-Tree:

- ▶ All leaves have the same depth
- ▶ Each inner node has  $\geq a$  and  $\leq b$  nodes  
(Only the root node may have less nodes)

- ▶ Each node with  $n$  children is called “node of degree  $n$ ” and holds  $n - 1$  sorted elements

# (a,b)-Trees

## Introduction

### (a,b)-Tree:

- ▶ All leaves have the same depth
- ▶ Each inner node has  $\geq a$  and  $\leq b$  nodes  
(Only the root node may have less nodes)

- ▶ Each node with  $n$  children is called “node of degree  $n$ ” and holds  $n - 1$  sorted elements
- ▶ Subtrees are located “between” the elements

# (a,b)-Trees

## Introduction

### (a,b)-Tree:

- ▶ All leaves have the same depth
- ▶ Each inner node has  $\geq a$  and  $\leq b$  nodes  
(Only the root node may have less nodes)

- ▶ Each node with  $n$  children is called “node of degree  $n$ ” and holds  $n - 1$  sorted elements
- ▶ Subtrees are located “between” the elements
- ▶ We require:  $a \geq 2$  and  $b \geq 2a - 1$

# (a,b)-Trees

## Introduction

### (2,4)-Tree:

Figure: Example of an (2,4)-tree

# (a,b)-Trees

## Introduction

### (2,4)-Tree:

Figure: Example of an (2,4)-tree

- (2,4)-tree with depth of 3

# (a,b)-Trees

## Introduction

### (2,4)-Tree:

Figure: Example of an (2,4)-tree

- ▶ (2,4)-tree with depth of 3
- ▶ Each node has between 2 and 4 children (1 to 3 elements)

# (a,b)-Trees

## Introduction

**Not an (2,4)-Tree:**

# (a,b)-Trees

## Introduction

**Not an (2,4)-Tree:**

Figure: **Not** an (2,4)-tree

- Invalid sorting

# (a,b)-Trees

## Introduction

**Not an (2,4)-Tree:**

Figure: **Not** an (2,4)-tree

- ▶ Invalid sorting
- ▶ Degree of node too large / too small

# (a,b)-Trees

## Introduction

**Not an (2,4)-Tree:**

Figure: **Not** an (2,4)-tree

- ▶ Invalid sorting
- ▶ Degree of node too large / too small
- ▶ Leaves on different levels

# (a,b)-Trees

Implementation - Lookup

**Searching an element:** (lookup)

# (a,b)-Trees

## Implementation - Lookup

**Searching an element:** (`lookup`)

- ▶ The same algorithm as in `BinarySearchTree`

# (a,b)-Trees

## Implementation - Lookup

### **Searching an element:** (lookup)

- ▶ The same algorithm as in `BinarySearchTree`
- ▶ Searching from the root downwards

# (a,b)-Trees

## Implementation - Lookup

### **Searching an element:** (lookup)

- ▶ The same algorithm as in `BinarySearchTree`
- ▶ Searching from the root downwards
- ▶ The keys at each node set the path

# (a,b)-Trees

## Implementation - Lookup

### Searching an element: (lookup)

- ▶ The same algorithm as in [BinarySearchTree](#)
- ▶ Searching from the root downwards
- ▶ The keys at each node set the path

# (a,b)-Trees

## Implementation - Insert

**Inserting an element:** (`insert`)

# (a,b)-Trees

## Implementation - Insert

**Inserting an element:** (`insert`)

- ▶ Search the position to insert the key into

# (a,b)-Trees

## Implementation - Insert

### Inserting an element: (`insert`)

- ▶ Search the position to insert the key into
- ▶ This position will always be an leaf

# (a,b)-Trees

## Implementation - Insert

### Inserting an element: (`insert`)

- ▶ Search the position to insert the key into
- ▶ This position will always be an leaf
- ▶ Insert the element into the tree

# (a,b)-Trees

## Implementation - Insert

### Inserting an element: (`insert`)

- ▶ Search the position to insert the key into
- ▶ This position will always be an leaf
- ▶ Insert the element into the tree
- ▶ **Attention:** Nodes can have one element too many (Degree  $b + 1$ )

# (a,b)-Trees

## Implementation - Insert

### Inserting an element: (`insert`)

- ▶ Search the position to insert the key into
- ▶ This position will always be an leaf
- ▶ Insert the element into the tree
- ▶ **Attention:** Nodes can have one element too many (Degree  $b + 1$ )
- ▶ Then we **split** the node

# (a,b)-Trees

## Implementation - Insert

Inserting an element: (`insert`)

Figure: Splitting a node

# (a,b)-Trees

## Implementation - Insert

Inserting an element: (`insert`)

Figure: Splitting a node

- If the degree is higher than  $b + 1$  we split the node

# (a,b)-Trees

## Implementation - Insert

Inserting an element: (`insert`)

Figure: Splitting a node

- ▶ If the degree is higher than  $b + 1$  we split the node
  - ▶ This results in a node with  $\text{ceil}(\frac{b-1}{2})$  elements, a element for the parent node, and a node with  $\text{floor}(\frac{b-1}{2})$  elements

# (a,b)-Trees

## Implementation - Insert

Inserting an element: (`insert`)

Figure: Splitting a node

- ▶ If the degree is higher than  $b + 1$  we split the node
  - ▶ This results in a node with  $\text{ceil}(\frac{b-1}{2})$  elements, a element for the parent node, and a node with  $\text{floor}(\frac{b-1}{2})$  elements
  - ▶ That's why we have the limit  $b \geq 2a - 1$

# (a,b)-Trees

## Implementation - Insert

**Inserting an element:** (`insert`)

# (a,b)-Trees

## Implementation - Insert

**Inserting an element:** (`insert`)

- ▶ If the degree is higher than  $b + 1$  we split the node

# (a,b)-Trees

## Implementation - Insert

### Inserting an element: (`insert`)

- ▶ If the degree is higher than  $b + 1$  we split the node
- ▶ Now the parent node can be of a higher degree than  $b + 1$

# (a,b)-Trees

## Implementation - Insert

### Inserting an element: (`insert`)

- ▶ If the degree is higher than  $b + 1$  we split the node
- ▶ Now the parent node can be of a higher degree than  $b + 1$
- ▶ We `split` the parent nodes the same way

# (a,b)-Trees

## Implementation - Insert

### Inserting an element: (`insert`)

- ▶ If the degree is higher than  $b + 1$  we split the node
- ▶ Now the parent node can be of a higher degree than  $b + 1$
- ▶ We `split` the parent nodes the same way
- ▶ If the node to split is the root we split it and create a new root node  
(The tree is now one level deeper)

# (a,b)-Trees

## Implementation - Remove

**Removing an element:** (`remove`)

# (a,b)-Trees

## Implementation - Remove

**Removing an element:** (`remove`)

- ▶ Search the element in  $O(\log n)$  time

# (a,b)-Trees

## Implementation - Remove

### Removing an element: (remove)

- ▶ Search the element in  $O(\log n)$  time
- ▶ **Case 1:** The element is contained by a leaf, remove it

# (a,b)-Trees

## Implementation - Remove

### Removing an element: (remove)

- ▶ Search the element in  $O(\log n)$  time
- ▶ **Case 1:** The element is contained by a leaf, remove it
- ▶ **Case 2:** The element is contained by an inner node

# (a,b)-Trees

## Implementation - Remove

### Removing an element: (`remove`)

- ▶ Search the element in  $O(\log n)$  time
- ▶ **Case 1:** The element is contained by a leaf, remove it
- ▶ **Case 2:** The element is contained by an inner node
  - ▶ Search the `successor` in the right subtree

# (a,b)-Trees

## Implementation - Remove

### Removing an element: (`remove`)

- ▶ Search the element in  $O(\log n)$  time
- ▶ **Case 1:** The element is contained by a leaf, remove it
- ▶ **Case 2:** The element is contained by an inner node
  - ▶ Search the `successor` in the right subtree
  - ▶ The `successor` is always contained by a leaf

# (a,b)-Trees

## Implementation - Remove

### Removing an element: (remove)

- ▶ Search the element in  $O(\log n)$  time
- ▶ **Case 1:** The element is contained by a leaf, remove it
- ▶ **Case 2:** The element is contained by an inner node
  - ▶ Search the **successor** in the right subtree
  - ▶ The **successor** is always contained by a leaf
  - ▶ Replace the element with its **successor** and delete the **successor** from the leaf

# (a,b)-Trees

## Implementation - Remove

### Removing an element: (remove)

- ▶ Search the element in  $O(\log n)$  time
- ▶ **Case 1:** The element is contained by a leaf, remove it
- ▶ **Case 2:** The element is contained by an inner node
  - ▶ Search the **successor** in the right subtree
  - ▶ The **successor** is always contained by a leaf
  - ▶ Replace the element with its **successor** and delete the **successor** from the leaf
- ▶ **Attention:** The leaf might be too small (degree of  $a - 1$ )  
⇒ We **rebalance** the tree

# (a,b)-Trees

- ▶ Now the parent node can be of degree  $a - 1$
- ▶ We combine parent nodes the same way
- ▶ If the root has only one child left we take the child as new root  
(The tree shrinks one level)

# (a,b)-Trees

## Runtime Complexity

**Runtime complexity of `lookup`, `insert` and `remove`:**

# (a,b)-Trees

## Runtime Complexity

**Runtime complexity of lookup, insert and remove:**

- ▶ All operations in  $O(d)$  with  $d$  being the depth of the tree

# (a,b)-Trees

## Runtime Complexity

**Runtime complexity of lookup, insert and remove:**

- ▶ All operations in  $O(d)$  with  $d$  being the depth of the tree
- ▶ Each node (except the root) has more than  $a$  children  
 $\Rightarrow n \geq a^{d-1}$  and  $d \leq 1 + \log_a n = O(\log_a n)$

# (a,b)-Trees

## Runtime Complexity

**Runtime complexity of lookup, insert and remove:**

- ▶ All operations in  $O(d)$  with  $d$  being the depth of the tree
- ▶ Each node (except the root) has more than  $a$  children  
 $\Rightarrow n \geq a^{d-1}$  and  $d \leq 1 + \log_a n = O(\log_a n)$
- ▶ If we look closer:

# (a,b)-Trees

## Runtime Complexity

### Runtime complexity of `lookup`, `insert` and `remove`:

- ▶ All operations in  $O(d)$  with  $d$  being the depth of the tree
- ▶ Each node (except the root) has more than  $a$  children  
 $\Rightarrow n \geq a^{d-1}$  and  $d \leq 1 + \log_a n = O(\log_a n)$
- ▶ If we look closer:
  - ▶ `lookup` always takes  $\Theta(d)$

# (a,b)-Trees

## Runtime Complexity

### Runtime complexity of `lookup`, `insert` and `remove`:

- ▶ All operations in  $O(d)$  with  $d$  being the depth of the tree
- ▶ Each node (except the root) has more than  $a$  children  
 $\Rightarrow n \geq a^{d-1}$  and  $d \leq 1 + \log_a n = O(\log_a n)$
- ▶ If we look closer:
  - ▶ `lookup` always takes  $\Theta(d)$
  - ▶ `insert` and `remove` often require only  $O(1)$  time

# (a,b)-Trees

## Runtime Complexity

### Runtime complexity of lookup, insert and remove:

- ▶ All operations in  $O(d)$  with  $d$  being the depth of the tree
- ▶ Each node (except the root) has more than  $a$  children  
 $\Rightarrow n \geq a^{d-1}$  and  $d \leq 1 + \log_a n = O(\log_a n)$
- ▶ If we look closer:
  - ▶ lookup always takes  $\Theta(d)$
  - ▶ insert and remove often require only  $O(1)$  time
  - ▶ Only in the worst case we have to split or combine all nodes on a path up to the root

# (a,b)-Trees

## Runtime Complexity

### Runtime complexity of `lookup`, `insert` and `remove`:

- ▶ All operations in  $O(d)$  with  $d$  being the depth of the tree
- ▶ Each node (except the root) has more than  $a$  children  
 $\Rightarrow n \geq a^{d-1}$  and  $d \leq 1 + \log_a n = O(\log_a n)$
- ▶ If we look closer:
  - ▶ `lookup` always takes  $\Theta(d)$
  - ▶ `insert` and `remove` often require only  $O(1)$  time
  - ▶ Only in the **worst case** we have to **split** or **combine** all nodes on a path up to the root
  - ▶ We want to analyse in detail

# (a,b)-Trees

## Runtime Complexity

### Runtime complexity of **lookup**, **insert** and **remove**:

- ▶ All operations in  $O(d)$  with  $d$  being the depth of the tree
- ▶ Each node (except the root) has more than  $a$  children  
 $\Rightarrow n \geq a^{d-1}$  and  $d \leq 1 + \log_a n = O(\log_a n)$
- ▶ If we look closer:
  - ▶ **lookup** always takes  $\Theta(d)$
  - ▶ **insert** and **remove** often require only  $O(1)$  time
  - ▶ Only in the **worst case** we have to **split** or **combine** all nodes on a path up to the root
  - ▶ We want to analyse in detail
  - ▶ Therefore instead of  $b \geq 2a - 1$  we need  $b \geq 2a$ .

# (a,b)-Trees

## Runtime Complexity

### Runtime complexity of **lookup**, **insert** and **remove**:

- ▶ All operations in  $O(d)$  with  $d$  being the depth of the tree
- ▶ Each node (except the root) has more than  $a$  children  
 $\Rightarrow n \geq a^{d-1}$  and  $d \leq 1 + \log_a n = O(\log_a n)$
- ▶ If we look closer:
  - ▶ **lookup** always takes  $\Theta(d)$
  - ▶ **insert** and **remove** often require only  $O(1)$  time
  - ▶ Only in the **worst case** we have to **split** or **combine** all nodes on a path up to the root
  - ▶ We want to analyse in detail
  - ▶ Therefore instead of  $b \geq 2a - 1$  we need  $b \geq 2a$ .

- ▶ Number of black nodes on path to leaves is equal
- ▶ Can be interpreted as (2,4)-tree (also named 2-3-4-tree)
- ▶ Each (2,4)-tree-node is a small red-black-tree with a black root node

# Red-Black-Trees

## Introduction

Figure: Example of an red-black-tree [Gna]

## ► General

[CRL01] Thomas H. Cormen, Ronald L. Rivest, and Charles E. Leiserson.

*Introduction to Algorithms.*

MIT Press, Cambridge, Mass, 2001.

[MS08] Kurt Mehlhorn and Peter Sanders.

Algorithms and data structures, 2008.

<https://people.mpi-inf.mpg.de/~mehlhorn/ftp/Mehlhorn-Sanders-Toolbox.pdf>.
