Binary Search Trees

# Sorted Sequences

## Introduction

**Structure:**

# Sorted Sequences

## Introduction

### **Structure:**

- ▶ We have a set of **keys** mapped to **values**

# Sorted Sequences

## Introduction

### Structure:

- ▶ We have a set of **keys** mapped to **values**
- ▶ We have a ordering **i** applied to the keys

# Sorted Sequences

## Introduction

### Structure:

- ▶ We have a set of **keys** mapped to **values**
- ▶ We have a ordering **i** applied to the keys
- ▶ We need the following operations:

# Sorted Sequences

## Introduction

### Structure:

- ▶ We have a set of **keys** mapped to **values**
- ▶ We have a ordering **i** applied to the keys
- ▶ We need the following operations:
  - ▶ **insert(key, value)**: Insert the given pair

# Sorted Sequences

## Introduction

### Structure:

- ▶ We have a set of **keys** mapped to **values**
- ▶ We have a ordering **i** applied to the keys
- ▶ We need the following operations:
  - ▶ **insert(key, value)**: Insert the given pair
  - ▶ **remove(key)**: Remove the pair with the given **key**

# Sorted Sequences

## Introduction

### Structure:

- ▶ We have a set of **keys** mapped to **values**
- ▶ We have a ordering **i** applied to the keys
- ▶ We need the following operations:
  - ▶ **insert(key, value)**: Insert the given pair
  - ▶ **remove(key)**: Remove the pair with the given **key**
  - ▶ **lookup(key)**: Find the element with the given **key**, if it is not available find the element with the next smallest key

# Sorted Sequences

## Introduction

### Structure:

- ▶ We have a set of **keys** mapped to **values**
- ▶ We have a ordering **i** applied to the keys
- ▶ We need the following operations:
  - ▶ **insert(key, value)**: Insert the given pair
  - ▶ **remove(key)**: Remove the pair with the given **key**
  - ▶ **lookup(key)**: Find the element with the given **key**, if it is not available find the element with the next smallest key
  - ▶ **next()/previous()**: Returns the element with the next bigger/smaller **key**. This enables iteration over all elements

# Sorted Sequences

## Introduction

**Application examples:**

# Sorted Sequences

## Introduction

### **Application examples:**

- ▶ Example: Database for books, products or apartments

# Sorted Sequences

## Introduction

### **Application examples:**

- ▶ Example: Database for books, products or apartments
- ▶ Large number of records (data sets / tuples)

# Sorted Sequences

## Introduction

### **Application examples:**

- ▶ Example: Database for books, products or apartments
- ▶ Large number of records (data sets / tuples)
- ▶ Typical query: Return all apartments with a monthly rent between 400€ and 600€

# Sorted Sequences

## Introduction

### **Application examples:**

- ▶ Example: Database for books, products or apartments
- ▶ Large number of records (data sets / tuples)
- ▶ Typical query: Return all apartments with a monthly rent between 400€ and 600€
  - ▶ This is called a **range query**

# Sorted Sequences

## Introduction

### Application examples:

- ▶ Example: Database for books, products or apartments
- ▶ Large number of records (data sets / tuples)
- ▶ Typical query: Return all apartments with a monthly rent between 400€ and 600€
  - ▶ This is called a **range query**
  - ▶ We can implement this with a combination of **lookup(key)** and **next()**

# Sorted Sequences

## Introduction

### Application examples:

- ▶ Example: Database for books, products or apartments
- ▶ Large number of records (data sets / tuples)
- ▶ Typical query: Return all apartments with a monthly rent between 400€ and 600€
  - ▶ This is called a **range query**
  - ▶ We can implement this with a combination of **lookup(key)** and **next()**
  - ▶ It's not essential if an apartments exists with **exactly** 400€ monthly rent

# Sorted Sequences

## Introduction

### Application examples:

- ▶ Example: Database for books, products or apartments
- ▶ Large number of records (data sets / tuples)
- ▶ Typical query: Return all apartments with a monthly rent between 400€ and 600€
  - ▶ This is called a **range query**
  - ▶ We can implement this with a combination of **lookup(key)** and **next()**
  - ▶ It's not essential if an apartments exists with **exactly** 400€ monthly rent
- ▶ We do not want to sort all elements every time on an **insert** operation

# Sorted Sequences

## Introduction

### Application examples:

- ▶ Example: Database for books, products or apartments
- ▶ Large number of records (data sets / tuples)
- ▶ Typical query: Return all apartments with a monthly rent between 400€ and 600€
  - ▶ This is called a **range query**
  - ▶ We can implement this with a combination of **lookup(key)** and **next()**
  - ▶ It's not essential if an apartments exists with **exactly** 400€ monthly rent
- ▶ We do not want to sort all elements every time on an **insert** operation
- ▶ How could we implement this?

# Sorted Sequences

Implementation 1 (not good) - Static Array

**Static array:**

3	5	9	14	18	21	26	40	41	42	43	46
---	---	---	----	----	----	----	----	----	----	----	----

# Sorted Sequences

3	5	9	14	18	21	26	40	41	42	43	46
---	---	---	----	----	----	----	----	----	----	----	----

- **lookup** in time  $O(\log n)$

# Sorted Sequences

## Implementation 1 (not good) - Static Array

### Static array:

3	5	9	14	18	21	26	40	41	42	43	46
---	---	---	----	----	----	----	----	----	----	----	----

- ▶ **lookup** in time  $O(\log n)$ 
  - ▶ With **binary search**

# Sorted Sequences

## Implementation 1 (not good) - Static Array

### Static array:

3	5	9	14	18	21	26	40	41	42	43	46
---	---	---	----	----	----	----	----	----	----	----	----

- ▶ **lookup** in time  $O(\log n)$ 
  - ▶ With **binary search**
  - ▶ Example: **lookup(41)**

# Sorted Sequences

## Implementation 1 (not good) - Static Array

### Static array:

3	5	9	14	18	21	26	40	41	42	43	46
---	---	---	----	----	----	----	----	----	----	----	----

- ▶ **lookup** in time  $O(\log n)$ 
  - ▶ With **binary search**
  - ▶ Example: **lookup(41)**
- ▶ **next** / **previous** in time  $O(1)$

# Sorted Sequences

## Implementation 1 (not good) - Static Array

### Static array:

3	5	9	14	18	21	26	40	41	42	43	46
---	---	---	----	----	----	----	----	----	----	----	----

- ▶ **lookup** in time  $O(\log n)$ 
  - ▶ With **binary search**
  - ▶ Example: **lookup(41)**
- ▶ **next** / **previous** in time  $O(1)$ 
  - ▶ They are next to each other

# Sorted Sequences

## Implementation 1 (not good) - Static Array

### Static array:

3	5	9	14	18	21	26	40	41	42	43	46
---	---	---	----	----	----	----	----	----	----	----	----

- ▶ **lookup** in time  $O(\log n)$ 
  - ▶ With **binary search**
  - ▶ Example: **lookup(41)**
- ▶ **next** / **previous** in time  $O(1)$ 
  - ▶ They are next to each other
- ▶ **insert** and **remove** up to  $\Theta(n)$

# Sorted Sequences

## Implementation 1 (not good) - Static Array

### Static array:

3	5	9	14	18	21	26	40	41	42	43	46
---	---	---	----	----	----	----	----	----	----	----	----

- ▶ **lookup** in time  $O(\log n)$ 
  - ▶ With **binary search**
  - ▶ Example: **lookup(41)**
- ▶ **next** / **previous** in time  $O(1)$ 
  - ▶ They are next to each other
- ▶ **insert** and **remove** up to  $\Theta(n)$ 
  - ▶ We have to copy up to  $n$  elements

# Sorted Sequences

## Implementation 2 (bad) - Hash Table

**Hash map:**

# Sorted Sequences

## Implementation 2 (bad) - Hash Table

### Hash map:

- ▶ `insert` and `remove` in  $O(1)$

# Sorted Sequences

## Implementation 2 (bad) - Hash Table

### Hash map:

- ▶ `insert` and `remove` in  $O(1)$

If the hash table is big enough and we use a good hash function

# Sorted Sequences

## Implementation 2 (bad) - Hash Table

### Hash map:

- ▶ `insert` and `remove` in  $O(1)$

If the hash table is big enough and we use a good hash function

- ▶ `lookup` in time  $O(1)$

# Sorted Sequences

## Implementation 2 (bad) - Hash Table

### Hash map:

- ▶ `insert` and `remove` in  $O(1)$

If the hash table is big enough and we use a good hash function

- ▶ `lookup` in time  $O(1)$

If element with **exactly** this key exists, otherwise we get `None` as result

- ▶ `next` / `previous` in time up to  $\Theta(n)$

# Sorted Sequences

## Implementation 2 (bad) - Hash Table

### Hash map:

- ▶ `insert` and `remove` in  $O(1)$

If the hash table is big enough and we use a good hash function

- ▶ `lookup` in time  $O(1)$

If element with **exactly** this key exists, otherwise we get `None` as result

- ▶ `next` / `previous` in time up to  $\Theta(n)$

Order of the elements is independent of the order of the keys

## Implementation - Node/Element - Python

```
class Node:
    """ Defines a node of a singly linked
        list.
    """

    def __init__(self, value, nextNode):
        self.value = value
        self.nextNode = nextNode

    def __init__(self, value):
        self.value = value;
        self.nextNode = None
```

# Linked Lists

Usage examples

**Creating linked lists - Python:**

# Linked Lists

## Usage examples

### Creating linked lists - Python:

► `first = Node(7)`

# Linked Lists

## Usage examples

### Creating linked lists - Python:

- ▶ `first = Node(7)`

- ▶ `first.nextNode = Node(3)`

# Linked Lists

## Usage examples

### Creating linked lists - Python:

- ▶ `first = Node(7)`

- ▶ `first.nextNode = Node(3)`

- ▶ `first.nextNode.value = 4`

# Linked Lists

## Implementation - Insert

**Inserting a node after node cur:**

# Linked Lists

## Implementation - Insert

**Inserting a node after node `cur`:**

# Linked Lists

## Implementation - Insert

**Inserting a node after node cur:**

- ▶ `ins = Node(n)`

# Linked Lists

## Implementation - Insert

**Inserting a node after node cur:**

► `ins = Node(n)`

# Linked Lists

## Implementation - Insert

**Inserting a node after node cur:**

- ▶ `ins.nextNode = cur.nextNode`

# Linked Lists

## Implementation - Insert

**Inserting a node after node cur:**

► `ins.nextNode = cur.nextNode`

# Linked Lists

## Implementation - Insert

**Inserting a node after node cur:**

- ▶ `cur.nextNode = ins`

# Linked Lists

## Implementation - Insert

**Inserting a node after node `cur`:**

► `cur.nextNode = ins`

# Linked Lists

## Implementation - Insert

**Inserting a node after node `cur` - single line of code:**

# Linked Lists

## Implementation - Insert

**Inserting a node after node `cur` - single line of code:**

# Linked Lists

## Implementation - Insert

**Inserting a node after node `cur` - single line of code:**

► `cur.nextNode = Node(value, cur.nextNode)`

# Linked Lists

## Implementation - Insert

**Inserting a node after node `cur` - single line of code:**

► `cur.nextNode = Node(value, cur.nextNode)`

# Linked Lists

## Implementation - Remove

**Removing a node** `cur`:

# Linked Lists

## Implementation - Remove

**Removing a node** `cur:`

# Linked Lists

## Implementation - Remove

### Removing a node cur:

- Find the predecessor of cur:

```
pre = first
while pre.nextNode != cur:
    pre = pre.nextNode
```

# Linked Lists

## Implementation - Remove

### Removing a node `cur`:

- Find the predecessor of `cur`:

```
pre = first
while pre.nextNode != cur:
    pre = pre.nextNode
```

- Runtime of  $O(n)$

# Linked Lists

## Implementation - Remove

### Removing a node `cur`:

- ▶ Find the predecessor of `cur`:

```
pre = first
while pre.nextNode != cur:
    pre = pre.nextNode
```

- ▶ Runtime of  $O(n)$
- ▶ Does not work for first node!

# Linked Lists

## Implementation - Remove

### Removing a node `cur`:

- ▶ Find the predecessor of `cur`:

```
pre = first  
while pre.nextNode != cur:  
    pre = pre.nextNode
```

- ▶ Runtime of  $O(n)$
- ▶ Does not work for first node!

# Linked Lists

## Implementation - Remove

**Removing a node** `cur`:

# Linked Lists

## Implementation - Remove

### **Removing a node** `cur`:

- ▶ Update the pointer to the next element:  
`pre.nextNode = cur.nextNode`

# Linked Lists

## Implementation - Remove

### Removing a node `cur`:

- ▶ Update the pointer to the next element:  
`pre.nextNode = cur.nextNode`
- ▶ `cur` will get automatically destroyed if no more references exist (`cur=None`)

# Linked Lists

## Implementation - Remove

### Removing a node `cur`:

- ▶ Update the pointer to the next element:  
`pre.nextNode = cur.nextNode`
- ▶ `cur` will get automatically destroyed if no more references exist (`cur=None`)

# Linked Lists

## Implementation - Remove

**Removing the first node:**

# Linked Lists

## Implementation - Remove

**Removing the first node:**

# Linked Lists

## Implementation - Remove

### Removing the first node:

- Update the pointer to the next element:  
`first = first.nextNode`

# Linked Lists

## Implementation - Remove

### Removing the first node:

- ▶ Update the pointer to the next element:  
`first = first.nextNode`
- ▶ `cur` will get automatically destroyed if no more references exist  
(`cur=None`)

# Linked Lists

## Implementation - Remove

### Removing the first node:

- Update the pointer to the next element:  
`first = first.nextNode`
- `cur` will get automatically destroyed if no more references exist  
(`cur=None`)

# Linked Lists

## Implementation - Remove

**Removing a node** cur: (General case)

```
if cur == first:
    first = first.nextNode
else:
    pre = first
    while pre.nextNode != cur:
        pre = pre.nextNode

    pre.nextNode = cur.nextNode
```

# Linked Lists

## Implementation - Head Node

**Using a head node:**

# Linked Lists

## Implementation - Head Node

### **Using a head node:**

- ▶ Advantage:

# Linked Lists

## Implementation - Head Node

### **Using a head node:**

- ▶ Advantage:
  - ▶ Deleting the first node is no special case

# Linked Lists

## Implementation - Head Node

### **Using a head node:**

- ▶ Advantage:
  - ▶ Deleting the first node is no special case
- ▶ Disadvantage
  - ▶ We have to consider the first node at other operations

# Linked Lists

## Implementation - Head Node

### **Using a head node:**

- ▶ Advantage:
  - ▶ Deleting the first node is no special case
- ▶ Disadvantage
  - ▶ We have to consider the first node at other operations
  - ▶ Iterating all nodes
  - ▶ Counting of all nodes

# Linked Lists

## Implementation - Head Node

### **Using a head node:**

- ▶ Advantage:
  - ▶ Deleting the first node is no special case
- ▶ Disadvantage
  - ▶ We have to consider the first node at other operations
  - ▶ Iterating all nodes
  - ▶ Counting of all nodes
  - ▶ ...

# Linked Lists

## Implementation - Head Node

### Using a head node:

- ▶ Advantage:
  - ▶ Deleting the first node is no special case
- ▶ Disadvantage
  - ▶ We have to consider the first node at other operations
  - ▶ Iterating all nodes
  - ▶ Counting of all nodes
  - ▶ ...

# Linked Lists

## Implementation - LinkedList - Python

```
class LinkedList:
    def __init__(self):
        self.itemCount = 0
        self.head = Node()
        self.last = self.head

    def size(self):
        return self.itemCount

    def isEmpty(self):
        return self.itemCount == 0
```

# Linked Lists

## Implementation - LinkedList - Python

```
def append(self, value):
```

```
...
```

```
def insertAfter(self, cur, value):
```

```
...
```

```
def remove(self, cur):
```

```
...
```

```
def get(self, position):
```

```
...
```

```
def contains(self, value):
```

```
...
```

# Linked Lists

## Implementation

**Head, last:**

# Linked Lists

## Implementation

**Head, last:**

# Linked Lists

## Implementation

**Head, last:**

- Head points to the first node, last to the last node

# Linked Lists

## Implementation

### Head, last:

- ▶ Head points to the first node, last to the last node
- ▶ We can append elements to the end of the list in  $O(1)$  through the last node

# Linked Lists

## Implementation

### Head, last:

- ▶ Head points to the first node, last to the last node
- ▶ We can append elements to the end of the list in  $O(1)$  through the last node
- ▶ We have to keep the pointer to last updated after all operations

# Linked Lists

## Implementation - Append

**Appending an element:**

# Linked Lists

## Implementation - Append

### Appending an element:

# Linked Lists

## Implementation - Append

### Appending an element:

```
def append(self, value):  
    last.nextNode = Node(value)  
    last = last.NextNode  
    itemCount += 1
```

# Linked Lists

## Implementation - Append

### Appending an element:

```
def append(self, value):  
    last.nextNode = Node(value)  
    last = last.NextNode  
    itemCount += 1
```

- ▶ The pointer to last avoids the iteration of the whole list

# Linked Lists

## Implementation - Insert After

**Inserting after node cur:**

# Linked Lists

## Implementation - Insert After

**Inserting after node** `cur`:

- ▶ The pointer to head is not modified

# Linked Lists

## Implementation - Insert After

### Inserting after node cur:

- ▶ The pointer to head is not modified

```
def insertAfter(self, cur, value):  
    if cur == last:  
        # also update last node  
        append(value)  
    else:  
        # last node is not modified  
        cur.nextNode = Node(value, \  
                             cur.nextNode)  
        itemCount += 1
```

# Linked Lists

## Implementation - Remove

**Remove node** `cur`:

# Linked Lists

## Implementation - Remove

**Remove node** `cur`:

- ▶ Searching the predecessor in  $O(n)$

# Linked Lists

## Implementation - Remove

### Remove node cur:

- ▶ Searching the predecessor in  $O(n)$

```
def remove(self, cur):  
    pre = first  
    while pre.nextNode != cur:  
        pre = pre.nextNode  
  
    pre.nextNode = cur.nextNode  
    itemCount -= 1  
  
    if pre.nextNode == None:  
        last = pre
```

# Linked Lists

## Implementation - Get

**Getting a reference to node at pos:**

- ▶ Iterate the entries of the list until at position in  $O(n)$

# Linked Lists

## Implementation - Get

### Getting a reference to node at pos:

- Iterate the entries of the list until at position in  $O(n)$

```
def get(self, pos):  
    if pos < 0 or pos >= itemCount:  
        return None  
  
    cur = head  
    for i in range(0, pos):  
        cur = cur.nextNode  
  
    return cur
```

# Linked Lists

Implementation - Contains

**Searching a value:**

# Linked Lists

## Implementation - Contains

### **Searching a value:**

- ▶ First element is head without an assigned value

# Linked Lists

## Implementation - Contains

### **Searching a value:**

- ▶ First element is head without an assigned value
- ▶ Iterate the entries of the list until value found in  $O(n)$

# Linked Lists

## Implementation - Contains

### Searching a value:

- ▶ First element is head without an assigned value
- ▶ Iterate the entries of the list until value found in  $O(n)$

```
def contains(self, value):  
    cur = head  
  
    for i in range(0, itemCount):  
        cur = cur.nextNode  
        if cur.value == value:  
            return True  
  
    return False
```

- ▶ Singly linked list:
  - ▶ `next` in  $O(1)$
  - ▶ `previous` in  $\Theta(n)$
  - ▶ `insert` in  $O(1)$
  - ▶ `remove` in  $\Theta(n)$
  - ▶ `lookup` in  $\Theta(n)$

# Linked Lists

## Runtime

### Runtime:

- ▶ Singly linked list:
  - ▶ `next` in  $O(1)$
  - ▶ `previous` in  $\Theta(n)$
  - ▶ `insert` in  $O(1)$
  - ▶ `remove` in  $\Theta(n)$
  - ▶ `lookup` in  $\Theta(n)$
- ▶ Better with `doubly linked lists`

# Linked Lists

## Doubly Linked List

**Doubly linked list:**

# Linked Lists

## Doubly Linked List

### **Doubly linked list:**

- ▶ Each node has a reference to its successor and its predecessor

# Linked Lists

## Doubly Linked List

### **Doubly linked list:**

- ▶ Each node has a reference to its successor and its predecessor
- ▶ We can iterate the list forward and backward

# Linked Lists

## Doubly Linked List

### Doubly linked list:

- ▶ Each node has a reference to its successor and its predecessor
- ▶ We can iterate the list forward and backward

# Linked Lists

## Doubly Linked List

**Doubly linked list:**

# Linked Lists

## Doubly Linked List

### **Doubly linked list:**

- ▶ It is helpful to have a **head** node

# Linked Lists

## Doubly Linked List

### **Doubly linked list:**

- ▶ It is helpful to have a **head** node
- ▶ We only need **one head** node if we connect the list cyclic

# Linked Lists

## Doubly Linked List

### Doubly linked list:

- ▶ It is helpful to have a **head** node
- ▶ We only need **one head** node if we connect the list cyclic

# Linked Lists

## Runtime

**Runtime of doubly linked list:**

# Linked Lists

## Runtime

### Runtime of doubly linked list:

- ▶ `next` and `previous` in  $O(1)$

# Linked Lists

## Runtime

### **Runtime of doubly linked list:**

- ▶ `next` and `previous` in  $O(1)$

Each element has a pointer to pred-/sucessor

# Linked Lists

## Runtime

### Runtime of doubly linked list:

- ▶ `next` and `previous` in  $O(1)$

Each element has a pointer to pred-/sucessor

- ▶ `insert` and `remove` in  $O(1)$

# Linked Lists

## Runtime

### Runtime of doubly linked list:

- ▶ `next` and `previous` in  $O(1)$

Each element has a pointer to pred-/sucessor

- ▶ `insert` and `remove` in  $O(1)$

A constant number of pointers needs to be modified

# Linked Lists

## Runtime

### Runtime of doubly linked list:

- ▶ `next` and `previous` in  $O(1)$

Each element has a pointer to pred-/sucessor

- ▶ `insert` and `remove` in  $O(1)$

A constant number of pointers needs to be modified

- ▶ `lookup` in  $\Theta(n)$

# Linked Lists

## Runtime

### Runtime of doubly linked list:

- ▶ `next` and `previous` in  $O(1)$

Each element has a pointer to pred-/sucessor

- ▶ `insert` and `remove` in  $O(1)$

A constant number of pointers needs to be modified

- ▶ `lookup` in  $\Theta(n)$

Even if the elements are sorted we can only retrieve them in  $\Theta(n)$

# Linked Lists

## Runtime

### Runtime of doubly linked list:

- ▶ `next` and `previous` in  $O(1)$

Each element has a pointer to pred-/sucessor

- ▶ `insert` and `remove` in  $O(1)$

A constant number of pointers needs to be modified

- ▶ `lookup` in  $\Theta(n)$

Even if the elements are sorted we can only retrieve them in  $\Theta(n)$  Why?

## Linked list in memory:

# Structure

Sorted Sequences

Linked Lists

Binary Search Trees

# Binary Search Trees

## Introduction

**Runtime of a search tree:**

# Binary Search Trees

## Introduction

### Runtime of a search tree:

- ▶ `next` and `previous` in  $O(1)$

# Binary Search Trees

## Introduction

### Runtime of a search tree:

- ▶ `next` and `previous` in  $O(1)$

Pointers corresponding to linked list

# Binary Search Trees

## Introduction

### Runtime of a search tree:

- ▶ `next` and `previous` in  $O(1)$

Pointers corresponding to linked list

- ▶ `insert` and `remove` in  $O(\log n)$

# Binary Search Trees

## Introduction

### Runtime of a search tree:

- ▶ `next` and `previous` in  $O(1)$

Pointers corresponding to linked list

- ▶ `insert` and `remove` in  $O(\log n)$

- ▶ `lookup` in  $O(\log n)$

# Binary Search Trees

## Introduction

### Runtime of a search tree:

- ▶ `next` and `previous` in  $O(1)$

Pointers corresponding to linked list

- ▶ `insert` and `remove` in  $O(\log n)$

- ▶ `lookup` in  $O(\log n)$

The structure helps searching efficiently

# Binary Search Trees

## Introduction

**Idea:**

# Binary Search Trees

## Introduction

### **Idea:**

- ▶ We define a total order for the search tree

# Binary Search Trees

## Introduction

### Idea:

- ▶ We define a total order for the search tree
- ▶ All nodes of the left subtree have **smaller keys** than the current node

# Binary Search Trees

## Introduction

### Idea:

- ▶ We define a total order for the search tree
- ▶ All nodes of the left subtree have **smaller keys** than the current node
- ▶ All nodes of the right subtree have **bigger keys** than the current node

# Binary Search Trees

## Introduction

- ▶ Edge direction indicates ordering

# Binary Search Trees

## Implementation

### **Implementation:**

# Binary Search Trees

## Implementation

### **Implementation:**

- ▶ For the heap we had all elements stored in an array
- ▶ Here we link all nodes through pointer / references, like linked lists

# Binary Search Trees

## Implementation

### **Implementation:**

- ▶ For the heap we had all elements stored in an array
- ▶ Here we link all nodes through pointer / references, like linked lists
- ▶ Each node has a pointer / reference to its children (`leftChild` / `rightChild`)

# Binary Search Trees

## Implementation

### Implementation:

- ▶ For the heap we had all elements stored in an array
- ▶ Here we link all nodes through pointer / references, like linked lists
- ▶ Each node has a pointer / reference to its children (`leftChild` / `rightChild`)
- ▶ `None` for missing children

# Binary Search Trees

## Implementation

### Implementation:

- ▶ For the heap we had all elements stored in an array
- ▶ Here we link all nodes through pointer / references, like linked lists
- ▶ Each node has a pointer / reference to its children (`leftChild` / `rightChild`)
- ▶ `None` for missing children

# Binary Search Trees

## Implementation

### **Implementation:**

# Binary Search Trees

## Implementation

### **Implementation:**

- ▶ We create a sorted doubly linked list of all elements

# Binary Search Trees

## Implementation

### **Implementation:**

- ▶ We create a sorted doubly linked list of all elements
- ▶ This enables an efficient implementation of (`next` / `previous`)

# Binary Search Trees

## Implementation

### Implementation:

- ▶ We create a sorted doubly linked list of all elements
- ▶ This enables an efficient implementation of (`next` / `previous`)

# Binary Search Trees

## Implementation - Lookup

**Lookup:**

# Binary Search Trees

## Implementation - Lookup

### **Lookup:**

- ▶ Definition:  
“ Search the element with the given key. If no element is found return the element with the next (bigger) key. ”

# Binary Search Trees

## Implementation - Lookup

### **Lookup:**

- ▶ Definition:  
“ Search the element with the given key. If no element is found return the element with the next (bigger) key. ”
- ▶ We search from the root downwards:

# Binary Search Trees

## Implementation - Lookup

### **Lookup:**

- ▶ Definition:  
“ Search the element with the given key. If no element is found return the element with the next (bigger) key. ”
- ▶ We search from the root downwards:
  - ▶ Compare the searched key with the key of the node

# Binary Search Trees

## Implementation - Lookup

### Lookup:

- ▶ Definition:
  - “ Search the element with the given key. If no element is found return the element with the next (bigger) key. ”
- ▶ We search from the root downwards:
  - ▶ Compare the searched key with the key of the node
  - ▶ Go to the left / right until the child is **None** or the key is found

# Binary Search Trees

## Implementation - Lookup

### Lookup:

- ▶ Definition:  
“ Search the element with the given key. If no element is found return the element with the next (bigger) key. ”
- ▶ We search from the root downwards:
  - ▶ Compare the searched key with the key of the node
  - ▶ Go to the left / right until the child is **None** or the key is found
  - ▶ If the key is not found return the next bigger one

# Binary Search Trees

## Implementation - Lookup

**For each node applies the total order:**

# Binary Search Trees

## Implementation - Lookup

**For each node applies the total order:**

keys of left subtree | `node.key` | keys of right subtree

# Binary Search Trees

## Implementation - Lookup

**For each node applies the total order:**

keys of left subtree | `node.key` | keys of right subtree

**Examples:**

Figure: Binary search tree with total order “i”

# Binary Search Trees

## Implementation - Lookup

**For each node applies the total order:**

keys of left subtree | `node.key` | keys of right subtree

**Examples:**

`lookup(14)`

Figure: Binary search tree with total order “i”

# Binary Search Trees

## Implementation - Lookup

**For each node applies the total order:**

keys of left subtree | `node.key` | keys of right subtree

**Examples:**

`lookup(14)`

`lookup(6)`

# Binary Search Trees

Implementation - Insert

**Insert:**

# Binary Search Trees

## Implementation - Insert

### **Insert:**

- ▶ We search for the key in our search tree

# Binary Search Trees

## Implementation - Insert

### **Insert:**

- ▶ We search for the key in our search tree
- ▶ If a node is found we replace the value with the new one

# Binary Search Trees

## Implementation - Insert

### **Insert:**

- ▶ We search for the key in our search tree
- ▶ If a node is found we replace the value with the new one
- ▶ Else we insert a new node

# Binary Search Trees

## Implementation - Insert

### **Insert:**

- ▶ We search for the key in our search tree
- ▶ If a node is found we replace the value with the new one
- ▶ Else we insert a new node
- ▶ If the key was not present we get a `None` entry

# Binary Search Trees

## Implementation - Insert

### **Insert:**

- ▶ We search for the key in our search tree
- ▶ If a node is found we replace the value with the new one
- ▶ Else we insert a new node
- ▶ If the key was not present we get a `None` entry
- ▶ We insert the node there

# Binary Search Trees

## Implementation - Insert

### Insert:

- ▶ We search for the key in our search tree
- ▶ If a node is found we replace the value with the new one
- ▶ Else we insert a new node
- ▶ If the key was not present we get a **None** entry
- ▶ We insert the node there

# Binary Search Trees

Runtime Complexity

**How long takes `insert` and `lookup`?**

# Binary Search Trees

## Runtime Complexity

**How long takes `insert` and `lookup`?**

- ▶ Up to  $\Theta(d)$ , with  $d$  being the `depth of the tree`  
(The longest path from the root to a leaf)

# Binary Search Trees

## Runtime Complexity

**How long takes insert and lookup?**

- ▶ Up to  $\Theta(d)$ , with  $d$  being the depth of the tree  
(The longest path from the root to a leaf)
- ▶ Best case with  $d = \log n$  the runtime is  $\Theta(\log n)$

# Binary Search Trees

## Runtime Complexity

**How long takes insert and lookup?**

- ▶ Up to  $\Theta(d)$ , with  $d$  being the depth of the tree  
(The longest path from the root to a leaf)
- ▶ Best case with  $d = \log n$  the runtime is  $\Theta(\log n)$
- ▶ Worst case with  $d = n$  the runtime is  $\Theta(n)$

# Binary Search Trees

## Runtime Complexity

**How long takes insert and lookup?**

- ▶ Up to  $\Theta(d)$ , with  $d$  being the depth of the tree  
(The longest path from the root to a leaf)
- ▶ Best case with  $d = \log n$  the runtime is  $\Theta(\log n)$
- ▶ Worst case with  $d = n$  the runtime is  $\Theta(n)$
- ▶ If we **always** want to have a runtime of  $\Theta(\log n)$  then we have to rebalance the tree

# Binary Search Trees

## Runtime Complexity

### How long takes **insert** and **lookup**?

- ▶ Up to  $\Theta(d)$ , with  $d$  being the **depth of the tree**  
(The longest path from the root to a leaf)
- ▶ **Best case** with  $d = \log n$  the runtime is  $\Theta(\log n)$
- ▶ **Worst case** with  $d = n$  the runtime is  $\Theta(n)$
- ▶ If we **always** want to have a runtime of  $\Theta(\log n)$  then we have to **rebalance** the tree

**Figure:** Degenerated binary tree  $d = n$

# Binary Search Trees

## Runtime Complexity

### How long takes *insert* and *lookup*?

- ▶ Up to  $\Theta(d)$ , with  $d$  being the *depth of the tree* (The longest path from the root to a leaf)
- ▶ *Best case* with  $d = \log n$  the runtime is  $\Theta(\log n)$
- ▶ *Worst case* with  $d = n$  the runtime is  $\Theta(n)$
- ▶ If we **always** want to have a runtime of  $\Theta(\log n)$  then we have to *rebalance* the tree
