Logarithms

Runtime analysis - Minsort

How long does the program run?

Runtime analysis - Minsort

How long does the program run?

- ▶ In the last lecture we had a schematic
- ▶ **Observation:** It is going to be “disproportionally” slower the more numbers are being sorted

Runtime analysis - Minsort

How long does the program run?

- ▶ In the last lecture we had a schematic
- ▶ **Observation:** It is going to be “disproportionally” slower the more numbers are being sorted
- ▶ How can we say more precisely what is happening?

Runtime analysis - Minsort

How can we analyze the runtime?

- ▶ Ideally we have a formula which provides the runtime of the program for an specific input

Runtime analysis - Minsort

How can we analyze the runtime?

- ▶ Ideally we have a formula which provides the runtime of the program for an specific input
- ▶ **Problem:** The runtime is also depending on many other influences, especially:
 - ▶ Which kind of computer is the code executed on
 - ▶ What is running in the background
 - ▶ Which compiler is used to compile the code

Runtime analysis - Minsort

How can we analyze the runtime?

- ▶ Ideally we have a formula which provides the runtime of the program for an specific input
- ▶ **Problem:** The runtime is also depending on many other influences, especially:
 - ▶ Which kind of computer is the code executed on
 - ▶ What is running in the background
 - ▶ Which compiler is used to compile the code
- ▶ **Abstraction 1:** Analyze the number of basic operations, rather than analyzing the runtime

Minsort

Basic Operations

Runtime analysis

Minsort

Heapsort

Introduction to Induction

Logarithms

Basic Operations

Incomplete list of basic operations:

- ▶ Arithmetic operation, for example: $a + b$
- ▶ Assignment of variables, for example: $x = y$
- ▶ Function call, for example: *minsort(lst)*

Basic Operations

Intuitive:

lines of code

Better:

lines of machine
code

Best:

process cycles

Important:

The actual runtime has to be roughly proportional to the number of operations.

Heapsort

Introduction to Induction

Logarithms

Runtime analysis - Minsort

How many operations does *Minsort* need?

- ▶ **Abstraction 2:** We calculate the upper (lower) bound, rather than counting the operations exactly

Reason: Runtime is approximated by number of basic operations, but we can still infer:

- ▶ Upper bound
- ▶ Lower bound

Runtime analysis - Minsort

How many operations does *Minsort* need?

- ▶ **Abstraction 2:** We calculate the upper (lower) bound, rather than counting the operations exactly

Reason: Runtime is approximated by number of basic operations, but we can still infer:

- ▶ Upper bound
 - ▶ Lower bound
-
- ▶ **Basic Assumption:**
 - ▶ n is size of the input data (i.e. array)
 - ▶ $T(n)$ number of operations for input n

Runtime analysis - Minsort

How many operations does *Minsort* need?

- ▶ **Observation:** The number of operations depends only on the size n of the array and not on the content!

Runtime analysis - Minsort

How many operations does *Minsort* need?

- ▶ **Observation:** The number of operations depends only on the size n of the array and not on the content!
- ▶ **Claim:** There are constants C_1 and C_2 such that:

$$C_1 \cdot n^2 \leq T(n) \leq C_2 \cdot n^2$$

Runtime analysis - Minsort

How many operations does *Minsort* need?

- ▶ **Observation:** The number of operations depends only on the size n of the array and not on the content!
- ▶ **Claim:** There are constants C_1 and C_2 such that:

$$C_1 \cdot n^2 \leq T(n) \leq C_2 \cdot n^2$$

- ▶ This is called “quadratic runtime” (due to n^2)

Runtime Example

Number of Steps
(runtime [s])

Runtime Example

Number of Steps
(runtime [s])

Runtime Example

Number of Steps
(runtime [s])

$C_2 = 7/2$ could have
been larger or small
(exact value not
relevant)

$$T(n) = \frac{1}{2}n^2 + 3n$$

$$\frac{1}{2} \cdot n^2$$

$C_1 = 1/2$ could have been
chosen smaller (not
relevant), but not larger

number of input elements n

Runtime analysis - Minsort

We declare:

- ▶ Runtime of operations: $T(n)$
- ▶ Number of Elements: n
- ▶ Constants: C_1 (lower bound), C_2 (upper bound)
$$C_1 \cdot n^2 \leq T(n) \leq C_2 \cdot n^2$$
- ▶ Number of operations in round i : T_i

Runtime analysis - Minsort

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

Like for the upper boundary there exists a C_1 . Summation analysis is the same

$$\begin{aligned} T(n) &\geq \sum_{i=1}^{n-1} C'_1 \cdot (n - i) = C'_1 \sum_{i=1}^{n-1} i \\ &\geq C'_1 \cdot \frac{(n-1) \cdot n}{2} \end{aligned}$$

Runtime analysis - Minsort

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

Like for the upper boundary there exists a C_1 . Summation analysis is the same, **only final approximation differs**

$$\begin{aligned} T(n) &\geq \sum_{i=1}^{n-1} C'_1 \cdot (n - i) = C'_1 \sum_{i=1}^{n-1} i \\ &\geq C'_1 \cdot \frac{(n-1) \cdot n}{2} \end{aligned}$$

How do we get to n^2 ?

Runtime analysis - Minsort

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

Like for the upper boundary there exists a C_1 . Summation analysis is the same, **only final approximation differs**

$$\begin{aligned} T(n) &\geq \sum_{i=1}^{n-1} C'_1 \cdot (n - i) = C'_1 \sum_{i=1}^{n-1} i \\ &\geq C'_1 \cdot \frac{(n-1) \cdot n}{2} \quad \text{How do we get to } n^2? \\ &\quad \Downarrow \quad n - 1 \geq \frac{n}{2} \text{ for } n \geq 2 \end{aligned}$$

Runtime analysis - Minsort

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

Like for the upper boundary there exists a C_1 . Summation analysis is the same, **only final approximation differs**

$$\begin{aligned} T(n) &\geq \sum_{i=1}^{n-1} C'_1 \cdot (n - i) = C'_1 \sum_{i=1}^{n-1} i \\ &\geq C'_1 \cdot \frac{(n-1) \cdot n}{2} \quad \text{How do we get to } n^2? \\ &\quad \Downarrow \quad n-1 \geq \frac{n}{2} \text{ for } n \geq 2 \\ &\geq C'_1 \cdot \frac{n \cdot n}{2 \cdot 2} \end{aligned}$$

Runtime analysis - Minsort

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

Like for the upper boundary there exists a C_1 . Summation analysis is the same, **only final approximation differs**

$$\begin{aligned} T(n) &\geq \sum_{i=1}^{n-1} C'_1 \cdot (n - i) = C'_1 \sum_{i=1}^{n-1} i \\ &\geq C'_1 \cdot \frac{(n-1) \cdot n}{2} \quad \text{How do we get to } n^2? \\ &\quad \Downarrow \quad n-1 \geq \frac{n}{2} \text{ for } n \geq 2 \\ &\geq C'_1 \cdot \frac{n \cdot n}{2 \cdot 2} = \frac{C'_1}{4} \cdot n^2 \end{aligned}$$

Runtime analysis - Minsort

Runtime Analysis:

- ▶ Upper bound: $T(n) \leq C'_2 \cdot n^2$

Runtime analysis - Minsort

Runtime Analysis:

- ▶ Upper bound: $T(n) \leq C'_2 \cdot n^2$
- ▶ Lower bound: $\frac{C'_1}{4} \cdot n^2 \leq T(n)$

Runtime analysis - Minsort

Runtime Analysis:

- ▶ Upper bound: $T(n) \leq C'_2 \cdot n^2$
- ▶ Lower bound: $\frac{C'_1}{4} \cdot n^2 \leq T(n)$

Summarized:

$$\frac{C'_1}{4} \cdot n^2 \leq T(n) \leq C'_2 \cdot n^2$$

Quadratic runtime proven:

$$C_1 \cdot n^2 \leq T(n) \leq C_2 \cdot n^2$$

Runtime Example

- ▶ The runtime is growing quadratic with the number of elements n in the list

Runtime Example

- ▶ The runtime is growing quadratic with the number of elements n in the list
- ▶ Let constants C_1 and C_2 for which $C_1 \cdot n^2 \leq T(n) \leq C_2 \cdot n^2$

Runtime Example

- ▶ The runtime is growing quadratic with the number of elements n in the list
- ▶ Let constants C_1 and C_2 for which $C_1 \cdot n^2 \leq T(n) \leq C_2 \cdot n^2$
- ▶ $2 \times$ elements $\Rightarrow 4 \times$ runtime

Runtime Example

Introduction to Induction

Logarithms

Induction

Basics:

Induction

Basics:

- ▶ You want to show assumption $A(n)$ is valid $\forall n \in \mathbb{N}$

Induction

Basics:

- ▶ You want to show assumption $A(n)$ is valid $\forall n \in \mathbb{N}$
- ▶ We show induction in two steps:

Induction

Basics:

- ▶ You want to show assumption $A(n)$ is valid $\forall n \in \mathbb{N}$
- ▶ We show induction in two steps:
 1. **Induction basis:** we show that our assumption is valid at one point (for example: $n = 1, A(1)$).

Induction

Basics:

- ▶ You want to show assumption $A(n)$ is valid $\forall n \in \mathbb{N}$
- ▶ We show induction in two steps:
 1. **Induction basis:** we show that our assumption is valid at one point (for example: $n = 1, A(1)$).
 2. **Induction step:** we show that the assumption is valid for all n (normally one step forward: $n = n + 1, A(1), \dots, A(n)$).

Induction

Basics:

- ▶ You want to show assumption $A(n)$ is valid $\forall n \in \mathbb{N}$
- ▶ We show induction in two steps:
 1. **Induction basis:** we show that our assumption is valid at one point (for example: $n = 1, A(1)$).
 2. **Induction step:** we show that the assumption is valid for all n (normally one step forward: $n = n + 1, A(1), \dots, A(n)$).
- ▶ If both has been proven, then $A(n)$ holds for all natural numbers n by **induction**

Induction - Example 1

Claim:

A **complete** binary tree of depth d has $n(d) = 2^d - 1$ nodes

Induction - Example 1

Claim:

A **complete** binary tree of depth d has $n(d) = 2^d - 1$ nodes

- ▶ **Induction basis:** Assumption holds for $d = 1$

Root

$$n(1) = 2^1 - 1 = 1$$

Figure: Tree of depth 1 has 1 node

Induction - Example 1

Claim:

A **complete** binary tree of depth d has $n(d) = 2^d - 1$ nodes

- **Induction basis:** Assumption holds for $d = 1$

Root

$$n(1) = 2^1 - 1 = 1$$

\Rightarrow correct ✓

Figure: Tree of depth 1 has 1 node

Induction - Example 1

Number of nodes $n(d)$ in a binary tree with depth d :

- ▶ **Induction assumption:** $n(d) = 2^d - 1$

Induction - Example 1

Number of nodes $n(d)$ in a binary tree with depth d :

- ▶ **Induction assumption:** $n(d) = 2^d - 1$
- ▶ **Induction basis:** $n(1) = 2^1 - 1 = 2^1 - 1 = 1$ ✓

Induction - Example 1

Number of nodes $n(d)$ in a binary tree with depth d :

- ▶ **Induction assumption:** $n(d) = 2^d - 1$
- ▶ **Induction basis:** $n(1) = 2^1 - 1 = 2^1 - 1 = 1$ ✓
- ▶ **Induction step:** to show for $d := d + 1$

Figure: Binary tree with subtrees

Induction - Example 1

Number of nodes $n(d)$ in a binary tree with depth d :

- ▶ **Induction assumption:** $n(d) = 2^d - 1$
- ▶ **Induction basis:** $n(1) = 2^1 - 1 = 2^1 - 1 = 1$ ✓
- ▶ **Induction step:** to show for $d := d + 1$

$$n(d + 1) = 2 \cdot n(d) + 1$$

Figure: Binary tree with subtrees

Induction - Example 1

Number of nodes $n(d)$ in a binary tree with depth d :

- ▶ **Induction assumption:** $n(d) = 2^d - 1$
- ▶ **Induction basis:** $n(1) = 2^1 - 1 = 2^1 - 1 = 1$ ✓
- ▶ **Induction step:** to show for $d := d + 1$

Figure: Binary tree with subtrees

$$\begin{aligned}n(d+1) &= 2 \cdot n(d) + 1 \\&= 2 \cdot (2^d - 1) + 1\end{aligned}$$

Induction - Example 1

Number of nodes $n(d)$ in a binary tree with depth d :

- ▶ **Induction assumption:** $n(d) = 2^d - 1$
- ▶ **Induction basis:** $n(1) = 2^1 - 1 = 2^1 - 1 = 1$ ✓
- ▶ **Induction step:** to show for $d := d + 1$

Figure: Binary tree with subtrees

$$\begin{aligned}n(d+1) &= 2 \cdot n(d) + 1 \\&= 2 \cdot (2^d - 1) + 1 \\&= 2^{d+1} - 2 + 1\end{aligned}$$

Induction - Example 1

Number of nodes $n(d)$ in a binary tree with depth d :

- ▶ **Induction assumption:** $n(d) = 2^d - 1$
- ▶ **Induction basis:** $n(1) = 2^1 - 1 = 2^1 - 1 = 1$ ✓
- ▶ **Induction step:** to show for $d := d + 1$

Figure: Binary tree with subtrees

$$\begin{aligned}n(d+1) &= 2 \cdot n(d) + 1 \\&= 2 \cdot (2^d - 1) + 1 \\&= 2^{d+1} - 2 + 1 \\&= 2^{d+1} - 1 \quad \checkmark\end{aligned}$$

Induction - Example 1

Number of nodes $n(d)$ in a binary tree with depth d :

- ▶ **Induction assumption:** $n(d) = 2^d - 1$
- ▶ **Induction basis:** $n(1) = 2^1 - 1 = 2^1 - 1 = 1$ ✓
- ▶ **Induction step:** to show for $d := d + 1$

Figure: Binary tree with subtrees

⇒ **By induction:**

$$\begin{aligned}n(d+1) &= 2 \cdot n(d) + 1 \\&= 2 \cdot (2^d - 1) + 1 \\&= 2^{d+1} - 2 + 1 \\&= 2^{d+1} - 1 \quad \checkmark\end{aligned}$$

$$n(d) = 2^d - 1 \quad \forall n \in \mathbb{N} \quad \square$$

Runtime - Heapsort

Heapsort has the following steps:

- ▶ **Initially:** heapify list of n elements

Runtime - Heapsort

Heapsort has the following steps:

- ▶ **Initially:** heapify list of n elements
- ▶ **Then:** until all n elements are sorted

Runtime - Heapsort

Heapsort has the following steps:

- ▶ **Initially:** heapify list of n elements
- ▶ **Then:** until all n elements are sorted
 - ▶ Remove root as minimal element

Runtime - Heapsort

Heapsort has the following steps:

- ▶ **Initially:** heapify list of n elements
- ▶ **Then:** until all n elements are sorted
 - ▶ Remove root as minimal element
 - ▶ Move last leaf to root position

Runtime - Heapsort

Heapsort has the following steps:

- ▶ **Initially:** heapify list of n elements
- ▶ **Then:** until all n elements are sorted
 - ▶ Remove root as minimal element
 - ▶ Move last leaf to root position
 - ▶ Repair heap by sifting

Runtime - Heapsort

Heapify

Runtime of heapify depends on depth d :

Runtime - Heapsort

Heapify

Runtime of heapify depends on depth d :

Runtime of heapify with depth of d :

- No costs at depth d with 2^{d-1} (or less) nodes

Runtime - Heapsort

Heapify

Runtime of heapify depends on depth d :

Runtime of heapify with depth of d :

- ▶ No costs at depth d with 2^{d-1} (or less) nodes
- ▶ The cost for sifting with depth 1 is at most $1C$ per node

Runtime - Heapsort

Heapify

Runtime of heapify depends on depth d :

Runtime of heapify with depth of d :

- ▶ No costs at depth d with 2^{d-1} (or less) nodes
- ▶ The cost for sifting with depth 1 is at most $1C$ per node
- ▶ In general: Sifting costs are linear with path length **and** number of nodes

Runtime - Heapsort

Heapify

Heapify total runtime:

Depth	Nodes	Path length	Costs per node
d	2^{d-1}	0	$\leq C \cdot 0$

Runtime - Heapsort

Heapify

Heapify total runtime:

Depth	Nodes	Path length	Costs per node
d	2^{d-1}	0	$\leq C \cdot 0$
$d - 1$	2^{d-2}	1	$\leq C \cdot 1$

Introduction to Induction

Logarithms

Induction - Example 2

- ▶ We want to proof (induction assumption):

$$\underbrace{\sum_{i=1}^d \left(i \cdot 2^{d-i} \right)}_{A(d)} \leq \underbrace{2^{d+1}}_{B(d)}$$

- ▶ We denote the left side with A , the right side with B

Induction - Example 2

- **Induction basis:** $d := 1$:

$$A(d) \leq B(d)$$

Induction - Example 2

- **Induction basis:** $d := 1$:

$$A(d) \leq B(d)$$

$$\sum_{i=1}^d \left(i \cdot 2^{d-i} \right) \leq 2^{d+1}$$

Induction - Example 2

- **Induction basis:** $d := 1$:

$$A(d) \leq B(d)$$

$$\sum_{i=1}^d (i \cdot 2^{d-i}) \leq 2^{d+1}$$

$$\sum_{i=1}^1 (i \cdot 2^{1-i}) \leq 2^{1+1}$$

Induction - Example 2

- **Induction basis:** $d := 1$:

$$A(d) \leq B(d)$$

$$\sum_{i=1}^d (i \cdot 2^{d-i}) \leq 2^{d+1}$$

$$\sum_{i=1}^1 (i \cdot 2^{1-i}) \leq 2^{1+1}$$

$$2^0 \leq 2^2 \quad \checkmark$$

Induction - Example 2

Induction step: ($d := d + 1$):

- ▶ **Idea:** Write down right hand formula and try to get $A(d)$ and $B(d)$ out of it

$$A(d) \leq B(d) \quad \Rightarrow \quad A(d+1) \leq B(d+1)$$

Induction - Example 2

Induction step: ($d := d + 1$):

- **Idea:** Write down right hand formula and try to get $A(d)$ and $B(d)$ out of it

$$A(d) \leq B(d) \quad \Rightarrow \quad A(d+1) \leq B(d+1)$$

$$\sum_{i=1}^{d+1} \left(i \cdot 2^{d+1-i} \right) \leq 2^{d+1+1}$$

Induction - Example 2

Induction step: ($d := d + 1$):

- **Idea:** Write down right hand formula and try to get $A(d)$ and $B(d)$ out of it

$$A(d) \leq B(d) \quad \Rightarrow \quad A(d+1) \leq B(d+1)$$

$$\sum_{i=1}^{d+1} (i \cdot 2^{d+1-i}) \leq 2^{d+1+1}$$
$$2 \cdot \sum_{i=1}^{d+1} (i \cdot 2^{d-i}) \leq 2 \cdot 2^{d+1}$$

\vdots

Induction - Example 2

Induction step: ($d := d + 1$):

\vdots

$$2 \cdot \sum_{i=1}^{d+1} \left(i \cdot 2^{d-i} \right) \leq 2 \cdot 2^{d+1}$$

Induction - Example 2

Induction step: ($d := d + 1$):

\vdots

$$2 \cdot \sum_{i=1}^{d+1} (i \cdot 2^{d-i}) \leq 2 \cdot 2^{d+1}$$

$$2 \cdot \sum_{i=1}^{d+1} (i \cdot 2^{d-i}) \leq 2 \cdot B(d)$$

Induction - Example 2

Induction step: ($d := d + 1$):

\vdots

$$2 \cdot \sum_{i=1}^{d+1} (i \cdot 2^{d-i}) \leq 2 \cdot 2^{d+1}$$

$$2 \cdot \sum_{i=1}^{d+1} (i \cdot 2^{d-i}) \leq 2 \cdot B(d)$$

$$2 \cdot \sum_{i=1}^d (i \cdot 2^{d-i}) + 2 \cdot (d+1) \cdot 2^{d-(d+1)} \leq 2 \cdot B(d)$$

Induction - Example 2

Induction step: ($d := d + 1$):

\vdots

$$2 \cdot \sum_{i=1}^{d+1} (i \cdot 2^{d-i}) \leq 2 \cdot 2^{d+1}$$

$$2 \cdot \sum_{i=1}^{d+1} (i \cdot 2^{d-i}) \leq 2 \cdot B(d)$$

$$2 \cdot \sum_{i=1}^d (i \cdot 2^{d-i}) + 2 \cdot (d+1) \cdot 2^{d-(d+1)} \leq 2 \cdot B(d)$$

$$2 \cdot A(d) + (d+1) \leq 2 \cdot B(d)$$

Induction - Example 2

Induction step: ($d := d + 1$):

\vdots

$$2 \cdot \sum_{i=1}^{d+1} (i \cdot 2^{d-i}) \leq 2 \cdot 2^{d+1}$$

$$2 \cdot \sum_{i=1}^{d+1} (i \cdot 2^{d-i}) \leq 2 \cdot B(d)$$

$$2 \cdot \sum_{i=1}^d (i \cdot 2^{d-i}) + 2 \cdot (d+1) \cdot 2^{d-(d+1)} \leq 2 \cdot B(d)$$

$$2 \cdot A(d) + (d+1) \leq 2 \cdot B(d)$$

► **Problem:** Does not work but claim still holds

Induction - Example 2

Working proof:

- Show a **little bit stronger** claim

$$\sum_{i=1}^d \left(i \cdot 2^{d-i} \right) \leq 2^{d+1} - d - 2 \leq 2^{d+1}$$

Induction - Example 2

Working proof:

- ▶ Show a **little bit stronger** claim

$$\sum_{i=1}^d \left(i \cdot 2^{d-i} \right) \leq 2^{d+1} - d - 2 \leq 2^{d+1}$$

- ▶ **Advantage:** Results in a stronger induction assumption
 \Rightarrow **exercise**

Introduction to Induction

Logarithms

Base of Logarithms

Logarithm to different bases:

$$\log_a n = \frac{\log_b n}{\log_b a} = \log_b n \cdot \frac{1}{\log_b a}$$

The only difference is a constant coefficient $\frac{1}{\log_b a}$

Examples:

- ▶ $\log_2 4 = \log_{10} 4 \cdot \frac{1}{\log_2 10} = 0.602 \dots \cdot 3.322 \dots = 2$ ✓
- ▶ $\log_{10} 1000 = \log_e 1000 \cdot \frac{1}{\log_e 10} = \ln 1000 \cdot \frac{1}{\ln 10} = 3$ ✓

Runtime Example

Runtime of $n \log_2 n$:

- ▶ Assume we have constants C_1 and C_2 with

$$C_1 \cdot n \cdot \log_2 n \leq T(n) \leq C_2 \cdot n \cdot \log_2 n \quad \text{for } n \geq 2$$

Runtime Example

Runtime of $n \log_2 n$:

- ▶ Assume we have constants C_1 and C_2 with

$$C_1 \cdot n \cdot \log_2 n \leq T(n) \leq C_2 \cdot n \cdot \log_2 n \quad \text{for } n \geq 2$$

- ▶ $2 \times$ elements \Rightarrow only slightly larger than $2 \times$ runtime

Runtime Example

Runtime of $n \log_2 n$:

- ▶ Assume we have constants C_1 and C_2 with

$$C_1 \cdot n \cdot \log_2 n \leq T(n) \leq C_2 \cdot n \cdot \log_2 n \quad \text{for } n \geq 2$$

- ▶ $2 \times$ elements \Rightarrow only slightly larger than $2 \times$ runtime
 - ▶ $C = 1 \text{ ns}$ (1 simple instruction $\approx 1 \text{ ns}$)

Runtime Example

Runtime of $n \log_2 n$:

- ▶ Assume we have constants C_1 and C_2 with

$$C_1 \cdot n \cdot \log_2 n \leq T(n) \leq C_2 \cdot n \cdot \log_2 n \quad \text{for } n \geq 2$$

- ▶ $2 \times$ elements \Rightarrow only slightly larger than $2 \times$ runtime
 - ▶ $C = 1 \text{ ns}$ (1 simple instruction $\approx 1 \text{ ns}$)
 - ▶ $n = 2^{20}$ (1 million numbers = 4 MB with 4 B/number)
 - ▶ $C \cdot n \cdot \log_2 n = 10^{-9} \text{ s} \cdot 2^{20} \cdot 20 = 21.0 \text{ ms}$

Runtime Example

Runtime of $n \log_2 n$:

- ▶ Assume we have constants C_1 and C_2 with

$$C_1 \cdot n \cdot \log_2 n \leq T(n) \leq C_2 \cdot n \cdot \log_2 n \quad \text{for } n \geq 2$$

- ▶ $2 \times$ elements \Rightarrow only slightly larger than $2 \times$ runtime
 - ▶ $C = 1 \text{ ns}$ (1 simple instruction $\approx 1 \text{ ns}$)
 - ▶ $n = 2^{20}$ (1 million numbers = 4 MB with 4 B/number)
 - ▶ $C \cdot n \cdot \log_2 n = 10^{-9} \text{ s} \cdot 2^{20} \cdot 20 = 21.0 \text{ ms}$
 - ▶ $n = 2^{30}$ (1 billion numbers = 4 GB)
 - ▶ $C \cdot n \cdot \log_2 n = 10^{-9} \text{ s} \cdot 2^{30} \cdot 30 = 32 \text{ s}$

Runtime Example

Runtime of $n \log_2 n$:

- ▶ Assume we have constants C_1 and C_2 with

$$C_1 \cdot n \cdot \log_2 n \leq T(n) \leq C_2 \cdot n \cdot \log_2 n \quad \text{for } n \geq 2$$

- ▶ $2 \times$ elements \Rightarrow only slightly larger than $2 \times$ runtime
 - ▶ $C = 1 \text{ ns}$ (1 simple instruction $\approx 1 \text{ ns}$)
 - ▶ $n = 2^{20}$ (1 million numbers = 4 MB with 4 B/number)
 - ▶ $C \cdot n \cdot \log_2 n = 10^{-9} \text{ s} \cdot 2^{20} \cdot 20 = 21.0 \text{ ms}$
 - ▶ $n = 2^{30}$ (1 billion numbers = 4 GB)
 - ▶ $C \cdot n \cdot \log_2 n = 10^{-9} \text{ s} \cdot 2^{30} \cdot 30 = 32 \text{ s}$
- ▶ **Runtime $n \log_2 n$ is nearly as good as linear!**
