Associative Arrays

How do we build a Map?

Reminder:

- ▶ An associative array is like a normal array, only that the indices are not $0, 1, 2, \dots$, but different, e.g. telephone numbers

Associative Arrays

How do we build a Map?

Reminder:

- ▶ An associative array is like a normal array, only that the indices are not $0, 1, 2, \dots$, but different, e.g. telephone numbers

Problem:

- ▶ Quickly find a element with a specific key

Associative Arrays

How do we build a Map?

Reminder:

- ▶ An associative array is like a normal array, only that the indices are not $0, 1, 2, \dots$, but different, e.g. telephone numbers

Problem:

- ▶ Quickly find an element with a specific key
- ▶ Naive solution: Store pairs of key and value in a normal field

Associative Arrays

How do we build a Map?

Reminder:

- ▶ An associative array is like a normal array, only that the indices are not $0, 1, 2, \dots$, but different, e.g. telephone numbers

Problem:

- ▶ Quickly find a element with a specific key
- ▶ Naive solution: Store pairs of key and value in a normal field
- ▶ For n keys searching requires $\Theta(n)$ time

Associative Arrays

How do we build a Map?

Reminder:

- ▶ An associative array is like a normal array, only that the indices are not $0, 1, 2, \dots$, but different, e.g. telephone numbers

Problem:

- ▶ Quickly find a element with a specific key
- ▶ Naive solution: Store pairs of key and value in a normal field
- ▶ For n keys searching requires $\Theta(n)$ time
- ▶ With a **hash map** this just requires $\Theta(1)$ in the best case, ... regardless how many elements are in the map!

Probability Calculation

Proof

Examples

Associative Arrays

The Hash Map

Idea:

- ▶ Mapping the keys onto indices with a **hash function**
- ▶ Store the values at the calculated indices in a normal array

Example:

- ▶ Key set: $x = \{3904433, 312692, 5148949\}$

Associative Arrays

The Hash Map

Idea:

- ▶ Mapping the keys onto indices with a **hash function**
- ▶ Store the values at the calculated indices in a normal array

Example:

- ▶ Key set: $x = \{3904433, 312692, 5148949\}$
- ▶ Hash function: $h(x) = x \bmod 5$, in the range $[0, \dots, 4]$

Associative Arrays

The Hash Map

Idea:

- ▶ Mapping the keys onto indices with a **hash function**
- ▶ Store the values at the calculated indices in a normal array

Example:

- ▶ Key set: $x = \{3904433, 312692, 5148949\}$
- ▶ Hash function: $h(x) = x \bmod 5$, in the range $[0, \dots, 4]$
- ▶ We need an array **T** with **5** elements.
A “hashtable” with 5 “buckets”

Associative Arrays

The Hash Map

Idea:

- ▶ Mapping the keys onto indices with a **hash function**
- ▶ Store the values at the calculated indices in a normal array

Example:

- ▶ Key set: $x = \{3904433, 312692, 5148949\}$
- ▶ Hash function: $h(x) = x \bmod 5$, in the range $[0, \dots, 4]$
- ▶ We need an array **T** with **5** elements.
A “hashtable” with 5 “buckets”
- ▶ The element with the key **x** is stored in $T[h(x)]$

Associative Arrays

The Hash Map

Storage:

Associative Arrays

Hash Collisions

Problem:

- ▶ Two keys are equal $h(x) = h(y)$ but not the values $x \neq y$

Associative Arrays

Hash Collisions

Problem:

- ▶ Two keys are equal $h(x) = h(y)$ but not the values $x \neq y$

Easiest Solution:

Associative Arrays

Hash Collisions

Problem:

- ▶ Two keys are equal $h(x) = h(y)$ but not the values $x \neq y$

Easiest Solution:

- ▶ Represent each bucket as list of key value pairs

Figure: Hashtable T

Associative Arrays

Hash Collisions

Problem:

- ▶ Two keys are equal $h(x) = h(y)$ but not the values $x \neq y$

Easiest Solution:

- ▶ Represent each bucket as list of key value pairs
- ▶ Append new values to the end of the list

Figure: Hashtable T

Associative Arrays

Expected Runtime

Best case:

- ▶ We have n keys which are equally distributed over m buckets
- ▶ We have $\approx \frac{n}{m}$ pairs per bucket
- ▶ The runtime for searching is nearly $\mathcal{O}(1)$ when **not** $n \gg m$

Best case

$(m = 5, n = 10)$

Associative Arrays

Expected Runtime

Worst case:

- ▶ All n keys are mapped onto the same bucket
- ▶ The runtime is $\Theta(n)$ for searching

Universal Hashing

Thought Experiment

Thought Experiment:

- ▶ A hash function is defined for a given key set

Universal Hashing

Thought Experiment

Thought Experiment:

- ▶ A hash function is defined for a given key set
- ▶ Find a set of keys resulting in a degenerated hash table

Universal Hashing

Thought Experiment

Thought Experiment:

- ▶ A *hash function* is defined for a given *key set*
- ▶ Find a *set of keys* resulting in a degenerated *hash table*
 - ▶ *The hash function stays fixed*

Universal Hashing

Thought Experiment

Thought Experiment:

- ▶ A **hash function** is defined for a given **key set**
- ▶ Find a **set of keys** resulting in a degenerated **hash table**
 - ▶ *The **hash function** stays fixed*
 - ▶ *For table size of 100: Try $100 \times (99 + 1)$ different numbers*

Universal Hashing

Thought Experiment

Thought Experiment:

- ▶ A **hash function** is defined for a given **key set**
- ▶ Find a **set of keys** resulting in a degenerated **hash table**
 - ▶ *The **hash function** stays fixed*
 - ▶ *For table size of 100: Try $100 \times (99 + 1)$ different numbers*
 - ▶ *Worst case: All 100 **key sets** map to one bucket*
- ▶ **Now:** Find a solution to avoid that problem

Universal Hashing

Idea

Solution: universal hashing

- Out of a set of hash functions we randomly choose one

Figure: Hash func. 1

Figure: Hash func. 2

Figure: Hash func. coll.

Universal Hashing

Idea

Solution: universal hashing

- ▶ Out of a set of hash functions we randomly choose one
- ▶ The **expected result** of the hash function is an equal distribution over the buckets

Figure: Hash func. 1

Figure: Hash func. 2

Figure: Hash func. coll.

Universal Hashing

Idea

Solution: universal hashing

- ▶ Out of a set of hash functions we randomly choose one
- ▶ The **expected result** of the hash function is an equal distribution over the buckets
- ▶ This hash function stays fixed for the lifetime of table
Optional: copy table with new hash when degenerated

Figure: Hash func. 1

Figure: Hash func. 2

X	$P(X)$
2	$1/36$
3	$2/36$
4	$3/36$
...	...
11	$2/36$
12	$1/36$

- Example rolling once: $\mathbb{E}(X) = 1 \cdot \frac{1}{6} + 2 \cdot \frac{1}{6} + \dots + 6 \cdot \frac{1}{6} = 3.5$
- Example rolling twice: $\mathbb{E}(X) = 2 \cdot \frac{1}{36} + 3 \cdot \frac{2}{36} + \dots + 12 \cdot \frac{1}{36} = 7$

Universal Hashing

Probability Calculation

Sum of expected values: For arbitrary discrete random variables X_1, \dots, X_n we can write:

$$\mathbb{E}(X_1 + \dots + X_n) = \mathbb{E}(X_1) + \dots + \mathbb{E}(X_n)$$

Universal Hashing

Probability Calculation

Sum of expected values: For arbitrary discrete random variables X_1, \dots, X_n we can write:

$$\mathbb{E}(X_1 + \dots + X_n) = \mathbb{E}(X_1) + \dots + \mathbb{E}(X_n)$$

Example: Throwing two dice

Universal Hashing

Probability Calculation

Sum of expected values: For arbitrary discrete random variables X_1, \dots, X_n we can write:

$$\mathbb{E}(X_1 + \dots + X_n) = \mathbb{E}(X_1) + \dots + \mathbb{E}(X_n)$$

Example: Throwing two dice

- ▶ X_1 : Expected result of dice 1: $\mathbb{E}(X_1) = 3.5$

Universal Hashing

Probability Calculation

Sum of expected values: For arbitrary discrete random variables X_1, \dots, X_n we can write:

$$\mathbb{E}(X_1 + \dots + X_n) = \mathbb{E}(X_1) + \dots + \mathbb{E}(X_n)$$

Example: Throwing two dice

- ▶ X_1 : Expected result of dice 1: $\mathbb{E}(X_1) = 3.5$
- ▶ X_2 : Expected result of dice 2: $\mathbb{E}(X_2) = 3.5$

Universal Hashing

Probability Calculation

Sum of expected values: For arbitrary discrete random variables X_1, \dots, X_n we can write:

$$\mathbb{E}(X_1 + \dots + X_n) = \mathbb{E}(X_1) + \dots + \mathbb{E}(X_n)$$

Example: Throwing two dice

- ▶ X_1 : Expected result of dice 1: $\mathbb{E}(X_1) = 3.5$
- ▶ X_2 : Expected result of dice 2: $\mathbb{E}(X_2) = 3.5$
- ▶ $X = X_1 + X_2$: Expected total number:

$$\mathbb{E}(X) = \mathbb{E}(X_1 + X_2) = \mathbb{E}(X_1) + \mathbb{E}(X_2) = 3.5 + 3.5 = 7$$

Universal Hashing

Probability Calculation

Corollary:

The probability of the event E is $p = P(E)$. Let X be the occurrences of the event E and n be the number of executions of the experiment. Then $\mathbb{E}(X) = n \cdot P(E) = n \cdot p$

Universal Hashing

Probability Calculation

Corollary:

The probability of the event E is $p = P(E)$. Let X be the occurrences of the event E and n be the number of executions of the experiment. Then $\mathbb{E}(X) = n \cdot P(E) = n \cdot p$

Example (Rolling the dice 60 times:)

$$\mathbb{E}(\text{occurrences of } 6) = \frac{1}{6} \cdot 60 = 10$$

Universal Hashing

Probability Calculation

Proof Corollary:

Indicator variable: X_i

Universal Hashing

Probability Calculation

Proof Corollary:

Indicator variable: X_i

$$X_i = \begin{cases} 1, & \text{if event occurs} \\ 0, & \text{else} \end{cases}$$

$$\Rightarrow X = \sum_{i=1}^n X_i$$

Universal Hashing

Probability Calculation

Proof Corollary:

Indicator variable: X_i

$$X_i = \begin{cases} 1, & \text{if event occurs} \\ 0, & \text{else} \end{cases}$$

$$\Rightarrow X = \sum_{i=1}^n X_i$$

$$\mathbb{E}(X) = \mathbb{E}\left(\sum_{i=1}^n X_i\right) = \sum_{i=1}^n \mathbb{E}(X_i) \stackrel{\text{def. } \mathbb{E}\text{-value}}{=} \sum_{i=1}^n p = n \cdot p$$

Universal Hashing

Probability Calculation

Proof Corollary:

Indicator variable: X_i

$$X_i = \begin{cases} 1, & \text{if event occurs} \\ 0, & \text{else} \end{cases}$$

$$\Rightarrow X = \sum_{i=1}^n X_i$$

$$\mathbb{E}(X) = \mathbb{E}\left(\sum_{i=1}^n X_i\right) = \sum_{i=1}^n \mathbb{E}(X_i) \stackrel{\text{def. } \mathbb{E}\text{-value}}{=} \sum_{i=1}^n p = n \cdot p$$

□

Def. \mathbb{E} -value: $\mathbb{E}(X_i) = 0 \cdot P(X_i = 0) + 1 \cdot P(X_i = 1) = P(X_i = 1)$

Proof

Examples

Universal Hashing

Proof

Given:

- ▶ We pick two random keys $x, y \in \mathbb{S} \mid x \neq y$ and a random hash function $h \in \mathbb{H}$

Universal Hashing

Proof

Given:

- ▶ We pick two random keys $x, y \in \mathbb{S} \mid x \neq y$ and a random hash function $h \in \mathbb{H}$
- ▶ We know the probability of a collision:

$$P(h(x) = h(y)) \leq c \cdot \frac{1}{m}$$

Universal Hashing

Proof

Given:

- ▶ We pick two random keys $x, y \in \mathbb{S} \mid x \neq y$ and a random hash function $h \in \mathbb{H}$
- ▶ We know the probability of a collision:

$$P(h(x) = h(y)) \leq c \cdot \frac{1}{m}$$

To proof:

$$\mathbb{E}[|S_i|] \leq 1 + c \cdot \frac{|\mathbb{S}|}{m} \quad \forall i$$

Universal Hashing

Proof

We know:

$$\mathbb{S}_i = \{x \in \mathbb{S} : h(x) = i\}$$

Universal Hashing

Proof

We know:

$$\mathbb{S}_i = \{x \in \mathbb{S} : h(x) = i\}$$

If $\mathbb{S}_i = \emptyset \Rightarrow |\mathbb{S}_i| = 0$

Universal Hashing

Proof

We know:

$$\mathbb{S}_i = \{x \in \mathbb{S} : h(x) = i\}$$

If $\mathbb{S}_i = \emptyset \Rightarrow |\mathbb{S}_i| = 0$ otherwise, let $x \in \mathbb{S}_i$ be any key

Universal Hashing

Proof

We know:

$$\mathbb{S}_i = \{x \in \mathbb{S} : h(x) = i\}$$

If $\mathbb{S}_i = \emptyset \Rightarrow |\mathbb{S}_i| = 0$ otherwise, let $x \in \mathbb{S}_i$ be any key

We define an indicator variable:

$$I_y = \begin{cases} 1, & \text{if } h(y) = i \\ 0, & \text{else} \end{cases} \quad y \in \mathbb{S} \setminus \{x\}$$

Universal Hashing

Proof

We know:

$$\mathbb{S}_i = \{x \in \mathbb{S} : h(x) = i\}$$

If $\mathbb{S}_i = \emptyset \Rightarrow |\mathbb{S}_i| = 0$ otherwise, let $x \in \mathbb{S}_i$ be any key

We define an indicator variable:

$$I_y = \begin{cases} 1, & \text{if } h(y) = i \\ 0, & \text{else} \end{cases} \quad y \in \mathbb{S} \setminus \{x\}$$

$$\Rightarrow |\mathbb{S}_i| = 1 + \sum_{y \in \mathbb{S} \setminus x} I_y$$

Universal Hashing

Proof

We know:

$$\mathbb{S}_i = \{x \in \mathbb{S} : h(x) = i\}$$

If $\mathbb{S}_i = \emptyset \Rightarrow |\mathbb{S}_i| = 0$ otherwise, let $x \in \mathbb{S}_i$ be any key

We define an indicator variable:

$$I_y = \begin{cases} 1, & \text{if } h(y) = i \\ 0, & \text{else} \end{cases} \quad y \in \mathbb{S} \setminus \{x\}$$

$$\Rightarrow |\mathbb{S}_i| = 1 + \sum_{y \in \mathbb{S} \setminus x} I_y$$

$$\Rightarrow \mathbb{E}(|\mathbb{S}_i|) = \mathbb{E}\left(1 + \sum_{y \in \mathbb{S} \setminus x} I_y\right) = 1 + \sum_{y \in \mathbb{S} \setminus x} \mathbb{E}(I_y)$$

Universal Hashing

Proof

Auxiliary calculation:

$$\begin{aligned}\mathbb{E}[I_y] &= P(I_y = 1) \\ &= P(h(y) = i) \\ &= P(h(y) = h(x)) \\ &\leq c \cdot \frac{1}{m}\end{aligned}$$

Universal Hashing

Proof

Auxiliary calculation:

$$\begin{aligned}\mathbb{E}[I_y] &= P(I_y = 1) \\ &= P(h(y) = i) \\ &= P(h(y) = h(x)) \\ &\leq c \cdot \frac{1}{m}\end{aligned}$$

Universal Hashing

Proof

Auxiliary calculation:

$$\begin{aligned}\mathbb{E}[I_y] &= P(I_y = 1) \\ &= P(h(y) = i) \\ &= P(h(y) = h(x)) \\ &\leq c \cdot \frac{1}{m}\end{aligned}$$

$$\begin{aligned}\textbf{Hence: } \mathbb{E}[|S_i|] &= 1 + \sum_{y \in S \setminus x} \mathbb{E}[I_y] \leq 1 + \sum_{y \in S \setminus x} c \cdot \frac{1}{m} \\ &= 1 + (|S| - 1) \cdot c \cdot \frac{1}{m} \\ &\leq 1 + |S| \cdot c \cdot \frac{1}{m} \\ &= 1 + c \cdot \frac{|S|}{m} \quad \square\end{aligned}$$

Universal Hashing

Proof

Auxiliary calculation:

$$\begin{aligned}\mathbb{E}[I_y] &= P(I_y = 1) \\ &= P(h(y) = i) \\ &= P(h(y) = h(x)) \\ &\leq c \cdot \frac{1}{m}\end{aligned}$$

Hence:
$$\mathbb{E}[|S_i|] = 1 + \sum_{y \in S \setminus x} \mathbb{E}[I_y] \leq 1 + \sum_{y \in S \setminus x} c \cdot \frac{1}{m}$$

$$\leq 1 + |S| \cdot c \cdot \frac{1}{m}$$

$$= 1 + c \cdot \frac{|S|}{m}$$

□

Universal Hashing

Proof

Auxiliary calculation:

$$\begin{aligned}\mathbb{E}[I_y] &= P(I_y = 1) \\ &= P(h(y) = i) \\ &= P(h(y) = h(x)) \\ &\leq c \cdot \frac{1}{m}\end{aligned}$$

$$\begin{aligned}\textbf{Hence: } \mathbb{E}[|S_i|] &= 1 + \sum_{y \in S \setminus x} \mathbb{E}[I_y] \leq 1 + \sum_{y \in S \setminus x} c \cdot \frac{1}{m} \\ &= 1 + (|S| - 1) \cdot c \cdot \frac{1}{m} \\ &\leq 1 + |S| \cdot c \cdot \frac{1}{m} \\ &= 1 + c \cdot \frac{|S|}{m}\end{aligned}$$

Universal Hashing

Examples

Negative example:

Universal Hashing

Examples

Negative example:

- ▶ The set of all h for which $h_a(x) = (a \cdot x) \bmod m$, for a $a \in \mathbb{U}$

Universal Hashing

Examples

Negative example:

- ▶ The set of all h for which $h_a(x) = (a \cdot x) \bmod m$, for a $a \in \mathbb{U}$
- ▶ Is not c -universal. Why?

Universal Hashing

Examples

Negative example:

- ▶ The set of all h for which $h_a(x) = (a \cdot x) \bmod m$, for a $a \in \mathbb{U}$
- ▶ Is not c -universal. Why?
- ▶ If universal:

$$\forall x, y \quad x \neq y: \frac{|\{h \in \mathbb{H} : h(x) = h(y)\}|}{|\mathbb{H}|} \leq c \cdot \frac{1}{m}$$

Universal Hashing

Examples

Negative example:

- ▶ The set of all h for which $h_a(x) = (a \cdot x) \bmod m$, for a $a \in \mathbb{U}$
- ▶ Is not c -universal. Why?
- ▶ If universal:

$$\forall x, y \quad x \neq y: \frac{|\{h \in \mathbb{H} : h(x) = h(y)\}|}{|\mathbb{H}|} \leq c \cdot \frac{1}{m}$$

- ▶ Which x, y lead to a relative collision count bigger than $\frac{c}{m}$?

Universal Hashing

Examples

Positive example:

- ▶ Let p be a big prime number, $p > m$ and $p \geq |\mathbb{U}|$

Universal Hashing

Examples

Positive example:

- ▶ Let p be a big prime number, $p > m$ and $p \geq |\mathbb{U}|$
- ▶ Let \mathbb{H} be the set of all h for which:

$$h_{a,b}(x) = ((a \cdot x + b) \bmod p) \bmod m,$$

where $1 \leq a < p$, $0 \leq b < p$

Universal Hashing

Examples

Positive example:

- ▶ Let p be a big prime number, $p > m$ and $p \geq |\mathbb{U}|$
- ▶ Let \mathbb{H} be the set of all h for which:

$$h_{a,b}(x) = ((a \cdot x + b) \bmod p) \bmod m,$$

where $1 \leq a < p$, $0 \leq b < p$

- ▶ This is \approx 1-universal, see Exercise 4.11 in Mehlhorn/Sanders

Universal Hashing

Examples

Positive example:

- ▶ Let p be a big prime number, $p > m$ and $p \geq |\mathbb{U}|$
- ▶ Let \mathbb{H} be the set of all h for which:

$$h_{a,b}(x) = ((a \cdot x + b) \bmod p) \bmod m,$$

where $1 \leq a < p$, $0 \leq b < p$

- ▶ This is ≈ 1 -universal, see Exercise 4.11 in Mehlhorn/Sanders
- ▶ E.g.: $U = \{0, \dots, 99\}$, $p = 101$, $a = 47$, $b = 5$

Universal Hashing

Examples

Positive example:

- ▶ Let p be a big prime number, $p > m$ and $p \geq |\mathbb{U}|$
- ▶ Let \mathbb{H} be the set of all h for which:

$$h_{a,b}(x) = ((a \cdot x + b) \bmod p) \bmod m,$$

where $1 \leq a < p$, $0 \leq b < p$

- ▶ This is \approx 1-universal, see Exercise 4.11 in Mehlhorn/Sanders
- ▶ E.g.: $U = \{0, \dots, 99\}$, $p = 101$, $a = 47$, $b = 5$
- ▶ Then $h(x) = ((47 \cdot x + 5) \bmod 101) \bmod m$

Universal Hashing

Examples

Positive example:

- ▶ Let p be a big prime number, $p > m$ and $p \geq |\mathbb{U}|$
- ▶ Let \mathbb{H} be the set of all h for which:

$$h_{a,b}(x) = ((a \cdot x + b) \bmod p) \bmod m,$$

where $1 \leq a < p$, $0 \leq b < p$

- ▶ This is \approx 1-universal, see Exercise 4.11 in Mehlhorn/Sanders
- ▶ E.g.: $U = \{0, \dots, 99\}$, $p = 101$, $a = 47$, $b = 5$
- ▶ Then $h(x) = ((47 \cdot x + 5) \bmod 101) \bmod m$
- ▶ Easy to implement but hard to proof

Universal Hashing

Examples

Positive example:

- ▶ Let p be a big prime number, $p > m$ and $p \geq |\mathbb{U}|$
- ▶ Let \mathbb{H} be the set of all h for which:

$$h_{a,b}(x) = ((a \cdot x + b) \bmod p) \bmod m,$$

where $1 \leq a < p$, $0 \leq b < p$

- ▶ This is ≈ 1 -universal, see Exercise 4.11 in Mehlhorn/Sanders
- ▶ E.g.: $U = \{0, \dots, 99\}$, $p = 101$, $a = 47$, $b = 5$
- ▶ Then $h(x) = ((47 \cdot x + 5) \bmod 101) \bmod m$
- ▶ Easy to implement but hard to proof
- ▶ Exercise: show empirically that it is 2-universal

Universal Hashing

Examples

Positive example:

- ▶ The set of hash functions is c -universal:

$$h_a(x) = a \bullet x \mod m, \quad a \in \mathbb{U}$$

Universal Hashing

Examples

Positive example:

- ▶ The set of hash functions is c -universal:

$$h_a(x) = a \bullet x \mod m, \quad a \in \mathbb{U}$$

- ▶ We define:

$$a = \sum_{0, \dots, k-1} a_i \cdot m^i, \quad k = \text{ceil}(\log_m |\mathbb{U}|)$$

$$x = \sum_{0, \dots, k-1} x_i \cdot m^i$$

Universal Hashing

Examples

Positive example:

- ▶ The set of hash functions is c -universal:

$$h_a(x) = a \bullet x \mod m, \quad a \in \mathbb{U}$$

- ▶ We define:

$$a = \sum_{0, \dots, k-1} a_i \cdot m^i, \quad k = \text{ceil}(\log_m |\mathbb{U}|)$$

$$x = \sum_{0, \dots, k-1} x_i \cdot m^i$$

- ▶ **Intuitive:** Scalar product with base m

$$a \bullet x = \sum_{0, \dots, k-1} a_i \cdot x_i$$

Universal Hashing

Examples

Example ($\mathbb{U} = \{0, \dots, 999\}$, $m = 10$, $a = 348$)

With $a = 348$: $a_2 = 3$, $a_1 = 4$, $a_0 = 8$

$$\begin{aligned}h_{348}(x) &= (a_2 \cdot x_2 + a_1 \cdot x_1 + a_0 \cdot x_0) \mod m \\&= (3x_2 + 4x_1 + 8x_0) \mod 10\end{aligned}$$

With $x = 127$: $x_2 = 1$, $x_1 = 2$, $x_0 = 7$

$$\begin{aligned}h_{348}(127) &= (3 \cdot x_2 + 4 \cdot x_1 + 8 \cdot x_0) \mod 10 \\&= (3 \cdot 1 + 4 \cdot 2 + 8 \cdot 7) \mod 10 \\&= 7\end{aligned}$$
