How long does the program run?

How long does the program run?

- ▶ In the last lecture we had a schematic
- ► **Observation:** It is going to be "disproportionaly" slower the more numbers are being sorted

How long does the program run?

- ▶ In the last lecture we had a schematic
- ► **Observation:** It is going to be "disproportionaly" slower the more numbers are being sorted
- How can we say more precisely what is happening?

How can we analyze the runtime?

Ideally we have a formula which provides the runtime of the program for an specific input

How can we analyze the runtime?

- Ideally we have a formula which provides the runtime of the program for an specific input
- ▶ **Problem:** The runtime is also depending on many other influences, especially:
 - ▶ Which kind of computer is the code executed on
 - What is running in the background
 - Which compiler is used to compile the code

How can we analyze the runtime?

- Ideally we have a formula which provides the runtime of the program for an specific input
- Problem: The runtime is also depending on many other influences, especially:
 - Which kind of computer is the code executed on
 - What is running in the background
 - Which compiler is used to compile the code
- ► **Abstraction 1:** Analyze the number of basic operations, rather than analyzing the runtime

Structure

Runtime Example Minsort

Basic Operations

Runtime analysis Minsort Heapsort Introduction to Induction

Logarithms

Basic Operations

Incomplete list of basic operations:

- Arithmetic operation, for example: a + b
- Assignment of variables, for example: x = y
- ► Function call, for example: minsort(lst)

Basic Operations

Intuitive:	Better:	Best:
lines of code	lines of machine code	process cycles

Important:

The actual runtime has to be roughly proportional to the number of operations.

Introduction to Induction

Logarithms

How many operations does *Minsort* need?

▶ **Abstraction 2:** We calculate the upper (lower) bound, rather than counting the operations exactly

Reason: Runtime is approximated by number of basic operations, but we can still infer:

- Upper bound
- ► Lower bound

How many operations does Minsort need?

▶ **Abstraction 2:** We calculate the upper (lower) bound, rather than counting the operations exactly

Reason: Runtime is approximated by number of basic operations, but we can still infer:

- Upper bound
- ► Lower bound
- Basic Assmuption:
 - n is size of the input data (i.e. array)
 - ightharpoonup T(n) number of operations for input n

How many operations does *Minsort* need?

▶ **Observation:** The number of operations depends only on the size *n* of the array and not on the content!

How many operations does *Minsort* need?

- ▶ **Observation:** The number of operations depends only on the size *n* of the array and not on the content!
- ▶ Claim: There are constants C_1 and C_2 such that:

$$C_1 \cdot n^2 \leq T(n) \leq C_2 \cdot n^2$$

How many operations does *Minsort* need?

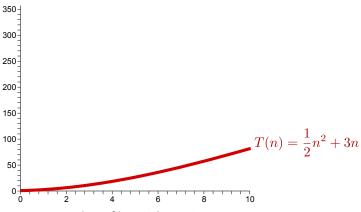

- ▶ **Observation:** The number of operations depends only on the size *n* of the array and not on the content!
- ▶ Claim: There are constants C_1 and C_2 such that:

$$C_1 \cdot n^2 \leq T(n) \leq C_2 \cdot n^2$$

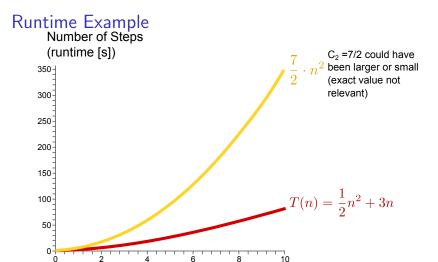

▶ This is called "quadratic runtime" (due to n^2)

Runtime Example Number of Steps

Number of Steps (runtime [s])

number of input elements n

number of input elements n

Runtime Example Number of Steps (runtime [s]) C_2 =7/2 could have n^2 been larger or small 350-(exact value not relevant) 300 250 200 150 100 50 C₁=1/2 could have been choosen smaller (not 0relevant), but not larger

number of input elements n

We declare:

▶ Runtime of operations: T(n)

Number of Elements: n

▶ Constants: C_1 (lower bound), C_2 (upper bound)

$$C_1 \cdot n^2 \leq T(n) \leq C_2 \cdot n^2$$

Number of operations in round i: T_i

Excursion - Small Gauss Formula

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

Like for the upper boundary there exists a C_1 . Summation analysis is the same

$$T(n) \geq \sum_{i=1}^{n-1} C_1' \cdot (n-i)$$

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

Like for the upper boundary there exists a C_1 . Summation analysis is the same

$$T(n) \geq \sum_{i=1}^{n-1} C'_1 \cdot (n-i) = C'_1 \sum_{i=1}^{n-1} i$$

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

Like for the upper boundary there exists a C_1 . Summation analysis is the same

$$T(n) \geq \sum_{i=1}^{n-1} C'_1 \cdot (n-i) = C'_1 \sum_{i=1}^{n-1} i$$

 $\geq C'_1 \cdot \frac{(n-1) \cdot n}{2}$

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

$$T(n) \geq \sum_{i=1}^{n-1} C'_1 \cdot (n-i) = C'_1 \sum_{i=1}^{n-1} i$$

$$\geq C'_1 \cdot \frac{(n-1) \cdot n}{2} \quad \text{How do we get to } n^2?$$

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

$$T(n) \geq \sum_{i=1}^{n-1} C'_1 \cdot (n-i) = C'_1 \sum_{i=1}^{n-1} i$$

$$\geq C'_1 \cdot \frac{(n-1) \cdot n}{2} \quad \text{How do we get to } n^2?$$

$$\downarrow \qquad n-1 \geq \frac{n}{2} \text{ for } n \geq 2$$

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

$$T(n) \geq \sum_{i=1}^{n-1} C'_1 \cdot (n-i) = C'_1 \sum_{i=1}^{n-1} i$$

$$\geq C'_1 \cdot \frac{(n-1) \cdot n}{2} \quad \text{How do we get to } n^2?$$

$$\downarrow \qquad n-1 \geq \frac{n}{2} \text{ for } n \geq 2$$

$$\geq C'_1 \cdot \frac{n \cdot n}{2 \cdot 2}$$

Proof of lower bound: $C_1 \cdot n^2 \leq T(n)$

$$T(n) \geq \sum_{i=1}^{n-1} C'_1 \cdot (n-i) = C'_1 \sum_{i=1}^{n-1} i$$

$$\geq C'_1 \cdot \frac{(n-1) \cdot n}{2} \quad \text{How do we get to } n^2?$$

$$\downarrow \qquad n-1 \geq \frac{n}{2} \text{ for } n \geq 2$$

$$\geq C'_1 \cdot \frac{n \cdot n}{2 \cdot 2} = \frac{C'_1}{4} \cdot n^2$$

Runtime Analysis:

▶ Upper bound: $T(n) \le C_2' \cdot n^2$

Runtime Analysis:

▶ Upper bound: $T(n) \le C_2' \cdot n^2$ ▶ Lower bound: $\frac{C_1'}{4} \cdot n^2 \le T(n)$

Runtime Analysis:

▶ Upper bound:
$$T(n) \le C_2' \cdot n^2$$

► Lower bound:
$$\frac{C_1'}{4} \cdot n^2 \le T(n)$$

Summarized:

$$\frac{C_1'}{4} \cdot n^2 \le T(n) \le C_2' \cdot n^2$$

Quadratic runtime proven:

$$C_1 \cdot n^2 \leq T(n) \leq C_2 \cdot n^2$$

► The runtime is growing quadratic with the number of elements *n* in the list

- ► The runtime is growing quadratic with the number of elements *n* in the list

Introduction to Induction

Logarithms

Induction

Basics:

Induction

Basics:

▶ You want to show assumption A(n) is valid $\forall n \in \mathbb{N}$

- ▶ You want to show assumption A(n) is valid $\forall n \in \mathbb{N}$
- ▶ We show induction in two steps:

- ▶ You want to show assumption A(n) is valid $\forall n \in \mathbb{N}$
- We show induction in two steps:
 - 1. **Induction basis:** we show that our assumption is valid at one point (for example: n = 1, A(1)).

- ▶ You want to show assumption A(n) is valid $\forall n \in \mathbb{N}$
- We show induction in two steps:
 - 1. **Induction basis:** we show that our assumption is valid at one point (for example: n = 1, A(1)).
 - 2. **Induction step:** we show that the assumption is valid for all n (normally one step forward: n = n + 1, A(1), ..., A(n)).

- ▶ You want to show assumption A(n) is valid $\forall n \in \mathbb{N}$
- We show induction in two steps:
 - 1. **Induction basis:** we show that our assumption is valid at one point (for example: n = 1, A(1)).
 - 2. **Induction step:** we show that the assumption is valid for all n (normally one step forward: n = n + 1, A(1), ..., A(n)).
- ▶ If both has been proven, then A(n) holds for all natural numbers n by **induction**

Claim:

Introduction to Induction

Logarithms

Heapsort has the following steps:

▶ **Initially:** heapify list of *n* elements

- ▶ Initially: heapify list of *n* elements
- ▶ Then: until all *n* elements are sorted

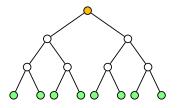

- ▶ **Initially:** heapify list of *n* elements
- ▶ Then: until all *n* elements are sorted
 - Remove root as minimal element

- ▶ **Initially:** heapify list of *n* elements
- ▶ Then: until all *n* elements are sorted
 - ▶ Remove root as minimal element
 - Move last leaf to root position

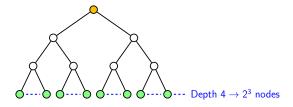

- ▶ **Initially:** heapify list of *n* elements
- ▶ Then: until all *n* elements are sorted
 - ▶ Remove root as minimal element
 - Move last leaf to root position
 - Repair heap by sifting

$\begin{array}{c} \text{Runtime - Heapsort} \\ \text{\tiny Heapify} \end{array}$

Runtime of heapify depends on depth d:

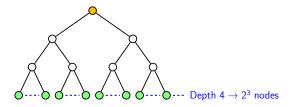

Runtime of heapify depends on depth d:

Runtime of heapify with depth of d:

▶ No costs at depth d with 2^{d-1} (or less) nodes

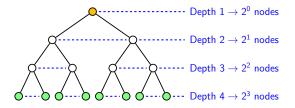

Runtime of heapify depends on depth d:

Runtime of heapify with depth of d:

- ▶ No costs at depth d with 2^{d-1} (or less) nodes
- ▶ The cost for sifting with depth 1 is at most 1C per node

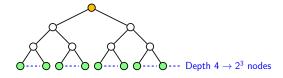

Runtime of heapify depends on depth d:

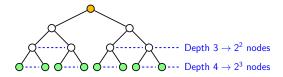

Runtime of heapify with depth of d:

- ▶ No costs at depth d with 2^{d-1} (or less) nodes
- ▶ The cost for sifting with depth 1 is at most 1C per node
- In general: Sifting costs are linear with path length and number of nodes

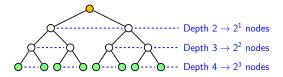

$\begin{array}{c} \text{Runtime - Heapsort} \\ \text{\tiny Heapify} \end{array}$

u	2^{d-1}	0	$\leq C \cdot 0$	
d-1	2^{d-2}	1	$\leq C \cdot 1$	

Depth	Nodes	Path length	Costs per node	
d	2^{d-1}	0	$\leq C \cdot 0$	
d-1		1	$\leq C \cdot 1$	
d-2	2^{d-3}	2	$\leq C \cdot 2$	

Heapify

Heapify total runtime:

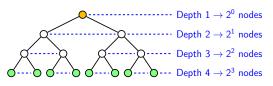

Generally: Depth $d \rightarrow 2^{d-1}$ nodes the Costs per node

Depth	Nodes	Path length	Costs per node	
d	2^{d-1}	0	≤ <i>C</i> ⋅ 0	
d-1	2^{d-2}	1	$\leq C \cdot 1$	
d-2	2^{d-3}	2	$\leq C \cdot 2$	
d-3	2^{d-4}	3	≤ <i>C</i> ⋅ 3	
	d - 1 $d - 2$	$ \begin{array}{c cc} d & 2^{d-1} \\ d-1 & 2^{d-2} \\ d-2 & 2^{d-3} \end{array} $	$ \begin{array}{c cccc} d & 2^{d-1} & 0 \\ d-1 & 2^{d-2} & 1 \\ d-2 & 2^{d-3} & 2 \end{array} $	$ \begin{array}{c cccccccccccccccccccccccccccccccc$

Heapify

Heapify total runtime:

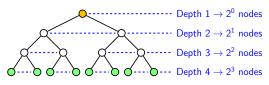

Generally: Depth $d \to 2^{d-1}$ nodes

	i e	i .	,	
Depth	Nodes	Path length	Costs per node	
d	2^{d-1}	0	$\leq C \cdot 0$	
d-1	2^{d-2}	1	$\leq C \cdot 1$	
d-2	2^{d-3}	2	$\leq C \cdot 2$	
d-3	2^{d-4}	3	$\leq C \cdot 3$	

In total: $T(d) \leq \sum_{i=1}^{d} \left(C \cdot (i-1) \cdot 2^{d-i} \right)$

Heapify

Heapify total runtime:

Generally: Depth $d \rightarrow 2^{d-1}$ nodes

Depth	Nodes	Path length	Costs per node	Upper bound
d	2^{d-1}	0	$\leq C \cdot 0$	
d-1	2^{d-2}	1	$\leq C \cdot 1$	Standard
d-2	2^{d-3}	2	$\leq C \cdot 2$	Equation
d-3	2^{d-4}	3	$\leq C \cdot 3$	

In total:
$$T(d) \le \sum_{i=1}^{d} \left(C \cdot (i-1) \cdot 2^{d-i} \right) \le \sum_{i=1}^{d} \left(C \cdot i \cdot 2^{d-i} \right)$$

Heapify

Heapify total runtime:

Generally: Depth $d \to 2^{d-1}$ nodes

Depth	Nodes	Path length	Costs per node	Upper bound
d	2^{d-1}	0	≤ <i>C</i> ⋅ 0	$\leq C \cdot 1$
d-1	2^{d-2}	1	$\leq C \cdot 1$	$\leq C \cdot 2$
d-2	2^{d-3}	2	$\leq C \cdot 2$	$\leq C \cdot 3$
d-3	2^{d-4}	3	$\leq C \cdot 3$	$\leq C \cdot 4$

In total:
$$T(d) \le \sum_{i=1}^d \left(C \cdot (i-1) \cdot 2^{d-i}\right) \le \sum_{i=1}^d \left(C \cdot i \cdot 2^{d-i}\right)$$

$$T(d) \le C \cdot \sum_{i=1}^{d} \left(i \cdot 2^{d-i} \right) \le C \cdot 2^{d+1}$$

Heapify total runtime:

$$T(d) \le C \cdot \sum_{i=1}^{d} \left(i \cdot 2^{d-i} \right) \le C \cdot 2^{d+1}$$

Hence: Resulting costs for heapify:

$$T(d) \leq C \cdot 2^{d+1}$$

Heapify total runtime:

$$T(d) \le C \cdot \sum_{i=1}^{d} \left(i \cdot 2^{d-i} \right) \le C \cdot 2^{d+1}$$

Hence: Resulting costs for heapify:

$$T(d) \leq C \cdot 2^{d+1}$$

▶ **However:** We want costs in relation to *n*

Runtime - Heapsort $_{\text{Heapify}}$

$$T(d) \leq C \cdot 2^{d+1}$$

Heapify total runtime:

$$T(d) \leq C \cdot 2^{d+1}$$

Introduction to Induction

Logarithms

▶ We want to proof (induction assumption):

$$\underbrace{\sum_{i=1}^{d} \left(i \cdot 2^{d-i} \right)}_{A(d) \le B(d)} \le 2^{d+1}$$

▶ We denote the left side with *A*, the right side with *B*

$$A(d) \leq B(d)$$

$$A(d) \le B(d)$$

$$\sum_{i=1}^{d} (i \cdot 2^{d-i}) \le 2^{d+1}$$

$$A(d) \le B(d)$$

$$\sum_{i=1}^{d} (i \cdot 2^{d-i}) \le 2^{d+1}$$

$$\sum_{i=1}^{1} (i \cdot 2^{1-i}) \le 2^{1+1}$$

$$A(d) \le B(d)$$

$$\sum_{i=1}^{d} (i \cdot 2^{d-i}) \le 2^{d+1}$$

$$\sum_{i=1}^{1} (i \cdot 2^{1-i}) \le 2^{1+1}$$

$$2^{0} \le 2^{2} \checkmark$$

Induction step: (d := d + 1):

▶ **Idea:** Write down right hand formula and try to get A(d) and B(d) out of it

$$A(d) \leq B(d)$$
 \Rightarrow $A(d+1) \leq B(d+1)$

Induction step: (d := d + 1):

▶ **Idea:** Write down right hand formula and try to get A(d) and B(d) out of it

$$A(d) \leq B(d)$$
 \Rightarrow $A(d+1) \leq B(d+1)$
$$\sum_{i=1}^{d+1} \left(i \cdot 2^{d+1-i} \right) \leq 2^{d+1+1}$$

Induction step: (d := d + 1):

▶ **Idea:** Write down right hand formula and try to get A(d) and B(d) out of it

$$A(d) \leq B(d) \qquad \Rightarrow \qquad A(d+1) \leq B(d+1)$$

$$\sum_{i=1}^{d+1} \left(i \cdot 2^{d+1-i} \right) \leq 2^{d+1+1}$$

$$2 \cdot \sum_{i=1}^{d+1} \left(i \cdot 2^{d-i} \right) \leq 2 \cdot 2^{d+1}$$

$$2 \cdot \sum_{i=1}^{d+1} \left(i \cdot 2^{d-i} \right) \le 2 \cdot 2^{d+1}$$

$$\vdots$$

$$2 \cdot \sum_{i=1}^{d+1} \left(i \cdot 2^{d-i} \right) \le 2 \cdot 2^{d+1}$$

$$2 \cdot \sum_{i=1}^{d+1} \left(i \cdot 2^{d-i} \right) \le 2 \cdot B(d)$$

$$\begin{aligned}
& \vdots \\
2 \cdot \sum_{i=1}^{d+1} \left(i \cdot 2^{d-i} \right) \le 2 \cdot 2^{d+1} \\
& 2 \cdot \sum_{i=1}^{d+1} \left(i \cdot 2^{d-i} \right) \le 2 \cdot B(d) \\
2 \cdot \sum_{i=1}^{d} \left(i \cdot 2^{d-i} \right) + 2 \cdot (d+1) \cdot 2^{d-(d+1)} \le 2 \cdot B(d)
\end{aligned}$$

$$2 \cdot \sum_{i=1}^{d+1} \left(i \cdot 2^{d-i} \right) \le 2 \cdot 2^{d+1}$$

$$2 \cdot \sum_{i=1}^{d+1} \left(i \cdot 2^{d-i} \right) \le 2 \cdot B(d)$$

$$2 \cdot \sum_{i=1}^{d} \left(i \cdot 2^{d-i} \right) + 2 \cdot (d+1) \cdot 2^{d-(d+1)} \le 2 \cdot B(d)$$

$$2 \cdot A(d) + (d+1) \le 2 \cdot B(d)$$

Induction step: (d := d + 1):

$$2 \cdot \sum_{i=1}^{d+1} \left(i \cdot 2^{d-i} \right) \le 2 \cdot 2^{d+1}$$
$$2 \cdot \sum_{i=1}^{d+1} \left(i \cdot 2^{d-i} \right) \le 2 \cdot B(d)$$
$$2 \cdot \sum_{i=1}^{d} \left(i \cdot 2^{d-i} \right) + 2 \cdot (d+1) \cdot 2^{d-(d+1)} \le 2 \cdot B(d)$$
$$2 \cdot A(d) + (d+1) \le 2 \cdot B(d)$$

Problem: Does not work but claim still holds

Working proof:

► Show a little bit stronger claim

$$\sum_{i=1}^{d} \left(i \cdot 2^{d-i} \right) \le 2^{d+1} - d - 2 \le 2^{d+1}$$

Working proof:

► Show a little bit stronger claim

$$\sum_{i=1}^{d} \left(i \cdot 2^{d-i} \right) \le 2^{d+1} - d - 2 \le 2^{d+1}$$

▶ Advantage: Results in a stronger induction assumption

$$\Rightarrow$$
 exercise

Logarithms

▶ Constant costs for taking out $n \times maximum$

- ▶ Constant costs for taking out $n \times maximum$
- \blacktriangleright Maximum of d steps repairing the heap n times

- ▶ Constant costs for taking out $n \times maximum$
- ► Maximum of *d* steps repairing the heap *n* times
- ▶ Depth of heap at the start is $d \le 1 + \log_2 n$ Why?

$$2^{d-1} \le n \Rightarrow d-1 \le \log_2 n \Rightarrow d \le 1 + \log_2 n$$

- ▶ Constant costs for taking out $n \times maximum$
- ▶ Maximum of *d* steps repairing the heap *n* times
- ▶ Depth of heap at the start is $d \le 1 + \log_2 n$ Why?

$$2^{d-1} \le n \implies d-1 \le \log_2 n \implies d \le 1 + \log_2 n$$

Recall: The depth and number of elements is decreasing

- ▶ Constant costs for taking out $n \times maximum$
- ▶ Maximum of *d* steps repairing the heap *n* times
- ▶ Depth of heap at the start is $d \le 1 + \log_2 n$ Why?

$$2^{d-1} \le n \ \Rightarrow \ d-1 \le \log_2 n \ \Rightarrow \ d \le 1 + \log_2 n$$

- ▶ Recall: The depth and number of elements is decreasing
 - ▶ Hence: $T(n) \le n \cdot (1 + \log_2 n) \cdot C$

- ▶ Constant costs for taking out $n \times maximum$
- Maximum of d steps repairing the heap n times
- ▶ Depth of heap at the start is $d \le 1 + \log_2 n$ Why?

$$2^{d-1} \le n \ \Rightarrow \ d-1 \le \log_2 n \ \Rightarrow \ d \le 1 + \log_2 n$$

- ▶ Recall: The depth and number of elements is decreasing
 - ▶ Hence: $T(n) \le n \cdot (1 + \log_2 n) \cdot C$
 - We can reduce this to:

$$T(n) \le 2 \cdot n \log_2 n \cdot C$$
 (holds for $n > 2$)

Runtime costs:

▶ Heapify: $T(n) \le 4 \cdot n \cdot C$

Runtime costs:

▶ Heapify: $T(n) \leq 4 \cdot n \cdot C$

▶ Remove: $T(n) \le 2 \cdot n \log_2 n \cdot C$

Runtime costs:

▶ Heapify: $T(n) \le 4 \cdot n \cdot C$

▶ Remove: $T(n) \le 2 \cdot n \log_2 n \cdot C$

▶ Total runtime: $T(n) \le 6 \cdot n \log_2 n \cdot C$

Runtime costs:

- ▶ Heapify: $T(n) \le 4 \cdot n \cdot C$
- ▶ Remove: $T(n) \le 2 \cdot n \log_2 n \cdot C$
- ▶ Total runtime: $T(n) \le 6 \cdot n \log_2 n \cdot C$
- Constraints:
 - ▶ Upper bound: $C_2 \cdot n \log_2 n \ge T(n)$ (for $n \ge 2$)
 - ▶ Lower bound: $C_1 \cdot n \log_2 n \le T(n)$ (for $n \ge 2$)

Runtime costs:

- ▶ Heapify: $T(n) \le 4 \cdot n \cdot C$
- ▶ Remove: $T(n) \le 2 \cdot n \log_2 n \cdot C$
- ▶ Total runtime: $T(n) \le 6 \cdot n \log_2 n \cdot C$
- Constraints:
 - ▶ Upper bound: $C_2 \cdot n \log_2 n \ge T(n)$ (for $n \ge 2$)
 - ▶ Lower bound: $C_1 \cdot n \log_2 n \le T(n)$ (for $n \ge 2$)
 - $ightharpoonup
 ightharpoonup C_1$ and C_2 are constant

Logarithms

Base of Logarithms

Logarithm to different bases:

$$\log_a n = \frac{\log_b n}{\log_b a} = \log_b n \cdot \frac{1}{\log_b a}$$

The only difference is a constant coefficient $\frac{1}{\log_b a}$

Examples:

▶
$$\log_{10} 1000 = \log_e 1000 \cdot \frac{1}{\log_e 10} = \ln 1000 \cdot \frac{1}{\ln 10} = 3$$
 ✓

Runtime of $n \log_2 n$:

$$C_1 \cdot n \cdot \log_2 n \le T(n) \le C_2 \cdot n \cdot \log_2 n$$
 for $n \ge 2$

Runtime of $n \log_2 n$:

Assume we have constants C_1 and C_2 with

$$C_1 \cdot n \cdot \log_2 n \le T(n) \le C_2 \cdot n \cdot \log_2 n$$
 for $n \ge 2$

▶ $2 \times$ elements \Rightarrow only slightly larger than $2 \times$ runtime

Runtime of $n \log_2 n$:

$$C_1 \cdot n \cdot \log_2 n \le T(n) \le C_2 \cdot n \cdot \log_2 n$$
 for $n \ge 2$

- ▶ $2 \times$ elements \Rightarrow only slightly larger than $2 \times$ runtime
 - $C=1\,\mathrm{ns}\;(1\;\mathrm{simple\;instruction}\;pprox 1\,\mathrm{ns})$

Runtime of $n \log_2 n$:

$$C_1 \cdot n \cdot \log_2 n \le T(n) \le C_2 \cdot n \cdot \log_2 n$$
 for $n \ge 2$

- ▶ $2 \times$ elements \Rightarrow only slightly larger than $2 \times$ runtime
 - $C = 1 \text{ ns } (1 \text{ simple instruction } \approx 1 \text{ ns})$
 - ▶ $n = 2^{20}$ (1 million numbers = 4 MB with 4 B/number)
 - $C \cdot n \cdot log_2 n = 10^{-9} \text{ s} \cdot 2^{20} \cdot 20 = 21.0 \text{ ms}$

Runtime of $n \log_2 n$:

$$C_1 \cdot n \cdot \log_2 n \le T(n) \le C_2 \cdot n \cdot \log_2 n$$
 for $n \ge 2$

- ▶ $2 \times$ elements \Rightarrow only slightly larger than $2 \times$ runtime
 - $C = 1 \text{ ns } (1 \text{ simple instruction } \approx 1 \text{ ns})$
 - ▶ $n = 2^{20}$ (1 million numbers = 4 MB with 4 B/number)
 - $C \cdot n \cdot log_2 n = 10^{-9} \text{ s} \cdot 2^{20} \cdot 20 = 21.0 \text{ ms}$
 - ▶ $n = 2^{30}$ (1 billion numbers = 4 GB)
 - $C \cdot n \cdot log_2 n = 10^{-9} \text{ s} \cdot 2^{30} \cdot 30 = 32 \text{ s}$

Runtime of $n \log_2 n$:

$$C_1 \cdot n \cdot \log_2 n \le T(n) \le C_2 \cdot n \cdot \log_2 n$$
 for $n \ge 2$

- ▶ $2 \times$ elements \Rightarrow only slightly larger than $2 \times$ runtime
 - $C = 1 \text{ ns } (1 \text{ simple instruction } \approx 1 \text{ ns})$
 - ▶ $n = 2^{20}$ (1 million numbers = 4 MB with 4 B/number)
 - $C \cdot n \cdot log_2 n = 10^{-9} \text{ s} \cdot 2^{20} \cdot 20 = 21.0 \text{ ms}$
 - $n = 2^{30}$ (1 billion numbers = 4 GB)
 - $C \cdot n \cdot log_2 n = 10^{-9} \, \text{s} \cdot 2^{30} \cdot 30 = 32 \, \text{s}$
- ► Runtime *n* log₂ *n* is nearly as good as linear!
